Chapter 1: Introduction

Bar code decoding laser engines and bar code decoding imager engines are designed to read, decode and collect bar coded data from any nearby compatible bar code label that is visible and on printed media.

The Bluetooth Ring Scanner consists of a ring decoder tethered to a sturdy, compact, mobile Bluetooth module and battery. The modules lightweight battery provides power to the ring decoder. The hand strap assembly is designed to be worn on the back of either hand or on either wrist. The hook and loop fabric on the hand strap enables one-handed installation, adjustment and removal of the hand strap.

Honeywell bar code decoding engines are factory programmed for the most common communication settings. If you need to change the default settings, programming is accomplished by scanning the bar codes in this guide.

An asterisk (*) next to an option indicates the default setting.

About This Guide

This Programmer's Guide contains general instruction and configuration / programming bar codes specifically designed for the Honeywell Bluetooth Ring Scanner Module and its tethered ring scanner and ring imager.

Please refer to the *Bluetooth Ring Scanner User's Guide* for assembly and use instruction.

Tethered Scanners and Mobile Bluetooth Scanners

This guide does not include the bar codes to be used when programming tethered scanners connected to a COM port or serial port on Bluetooth enabled mobile devices or their cradles/docks or Bluetooth mobile scanners /imagers with trigger handles.

Please refer to the scanner and imager manufacturers User Guide. The manufacturer usually includes the printed manuals with the tethered device or mobile Bluetooth device.

Note: Full programming guides for Bluetooth bar code decoders and COM port tethered scanners may be available on the manufacturer's web site.

Bar Codes, Ring Scanners and Scanner Engines

Bluetooth enabled mobile devices can pair with more than one Bluetooth bar code reader at a time. The Bluetooth enabled mobile device can only manipulate the data received from one bar code reading device at a time.

See section titled [Identify Your Ring Bar Code Decoder Type](#) before scanning any bar code in this programming guide.

Note: The function to use the imager for OCR decoding is not supported in this release.

When using the ring device to scan the bar codes in this guide, the user can change scanning parameters for the Bluetooth Module such as:

- Enable / disable suspend timeout length
- Set the Beeper volume (Bluetooth module only)
- Assign a Friendly Name
- and Restore the Bluetooth Module to factory default settings.

And, for the tethered ring decoder parameters:

- Enable / disable a specific bar code type (UPC/EAN, Code 90, PDF417, and many others)
- Scan beam timing – short, medium, long
- Set bar code type parameters

It is important that the bar codes in this guide to be scanned by any device are the bar codes that have been designed specifically for the specific device.

[Bluetooth Module](#) – Use the programming bar codes created specifically for the Bluetooth Ring Scanner module.

[Laser Scanner](#) – Use programming bar codes created specifically for the SE955 scanner engine in the Ring Scanner cabled to the Bluetooth Ring Scanner module.

[Laser Imager](#) – Use programming bar codes created specifically for the SE4400 imager engine in the Ring Imager cabled to the Bluetooth Ring Scanner module.

Supported scanning ranges for the different bar code readers are contained in [Decode Zones](#).

Note: Wireless handheld Bluetooth scanner and Bluetooth imager programming bar codes and user instruction is not included in this guide.

Tether Connectors

Note: The Bluetooth Module ring scanner and ring imager connectors are not interchangeable with the ring scanner and ring imager connectors designed for the HX2 or the HX3 mobile device.

For HX2 and ring scanner/ring imager component description, installation and instruction please refer to the [HX2 User's Guide](#), [HX2 Reference Guide](#), and the [Ring Scanner Programming Guide](#).

For HX3 and ring scanner/ring imager component description, installation and instruction please refer to the [HX3 User's Guide](#), [HX3 Reference Guide](#), and the [Ring Scanner Programming Guide](#).

Identify Your Ring Bar Code Decoder Type

- Keep fingers away from the scan trigger when looking at the scanner/imager lens.
- Do not look into the ring scanner/imager lens.
- Do not stare directly into any beam emitted from the scanner/imager lens.

Note: *Imagers and scanners use laser beams when scanning a bar code.*

- The ring scanner has an SE955 scan engine. Program the scan engine with [SE955](#) bar codes.
- The ring imager has an SE4400 scan engine. Program the imager engine with [SE4400](#) bar codes.

Carefully look at the laser apertures of your ring scanning devices. The imager has three small illumination LEDs at the top of the scan aperture, the laser scanner does not have illumination LEDs.

Ring Imager (L) and Ring Scanner (R)

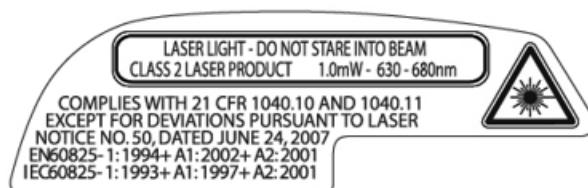

Laser Warnings and Labels

- Do not look into the ring scanner/imager aperture.
- Do not stare directly into the ring scanner/imager laser beam.
- Do not remove the laser caution labels from the ring scanner and ring imager.
- Do not connect the ring decoder aperture to any other device.

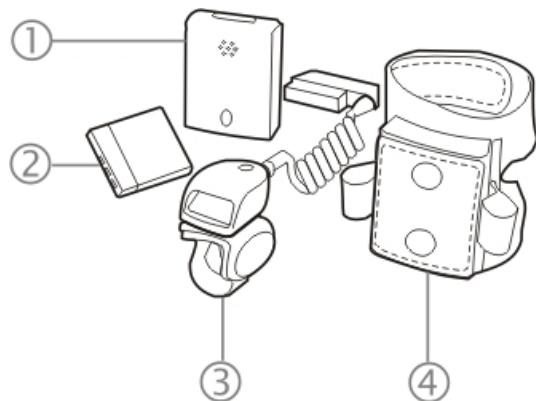

Caution:	<p>Laser radiation when open. Please read the caution labels. Use of controls, adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure. Class 2 laser scanners use a low power, visible light diode. As with any very bright light source, such as the sun, the user should avoid staring directly into the light beam. Momentary exposure to a Class 2 laser is not known to be harmful.</p>
----------	---

Ring Scanner and Ring Imager Caution Label – Class 2 Laser Scanner

The laser light label is located on the side of the ring scanner and on the side of the ring imager.

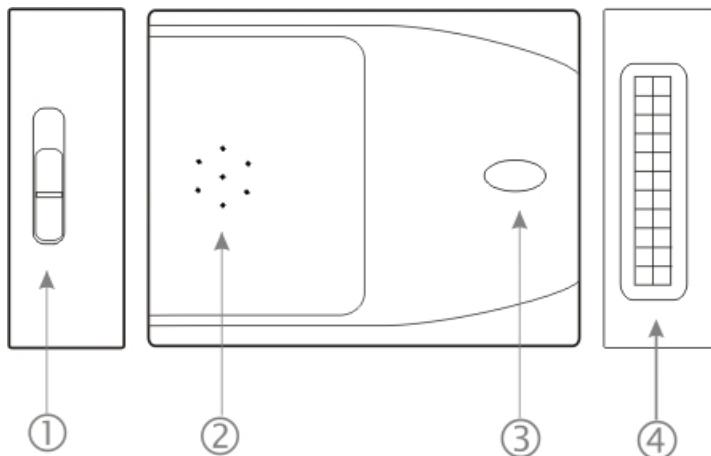

Components

1. Bluetooth Module
2. Battery
3. Ring Scanner
4. Wrist Strap / Back of Hand Strap

Bluetooth Module

Note: The Bluetooth Module ring scanner and ring imager connectors are not interchangeable with the ring scanner and ring imager connectors designed for the HX2 or the HX3 mobile device.

1. Battery Compartment Latch
2. Speaker
3. LED
4. I/O Port: Ring Device Cable Connection

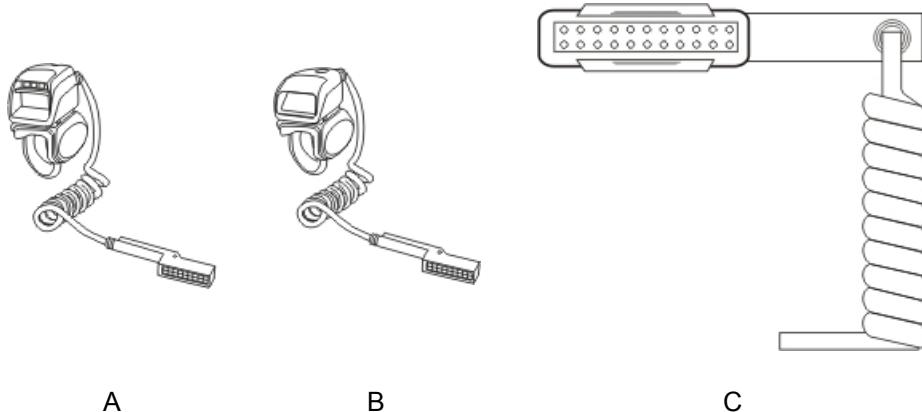

Ring Imager / Ring Scanner

The ring imager can scan and decode 1D and 2D bar codes. The ring scanner can scan and decode 1D bar codes.

After pairing with a Honeywell mobile device, the ring device can then send the collected bar code data to the specific Bluetooth enabled Honeywell mobile device for processing.

The Bluetooth Ring Scanner module emits good read or bad read sounds based on the ring scan results. See section titled [Status LED and Beep Indicators](#) for an explanation of the LED and beep patterns emitted.

Note: These ring decoding devices do not have the ability to emit a good read or bad read sound.

A

B

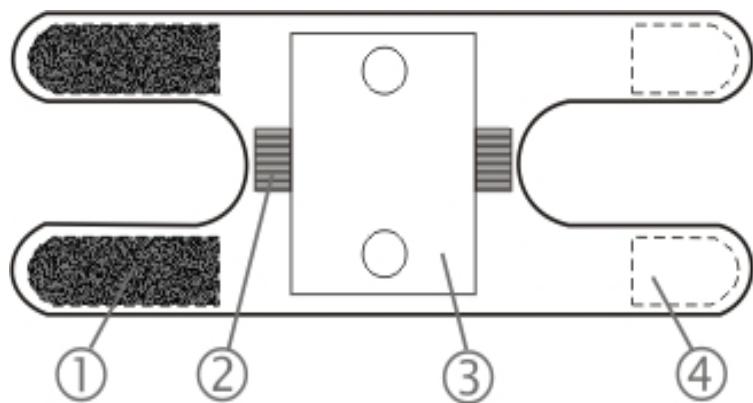

C

- A. Ring Imager
- B. Ring Scanner
- C. Cable Connector

Note: Do not touch, push against or brace your finger on the scan aperture at any time.

When new, there is a clear, tabbed protective film covering the ring decoder scan window. Remove and discard the clear, tabbed protective film before scanning a bar code.

Wrist Strap / Back of Hand Strap

1. Loops
2. Elastic ring cable protector
3. Bluetooth module sleeve
4. Hooks

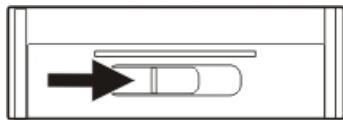

Press loops (on top of wrist strap) against hooks (on bottom of wrist strap) to secure wrist strap.

Inserting the Battery

The battery is spring loaded and will slide out when the battery cover latch is opened. The battery slides out of the battery bay far enough to be grasped, removed and then replaced with a fully powered battery.

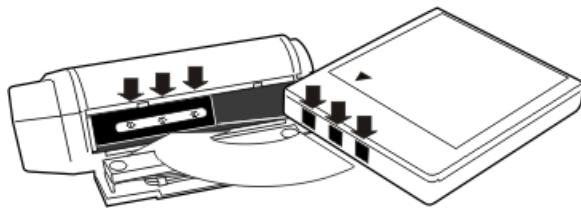

Note: A ring should be connected to the module before a battery is inserted in the module.

1. To open the module, orient the module so the Bluetooth LED on the module is facing upward.
2. Slide the battery bay latch to the right. The battery bay cover springs open.

Note: As soon as the battery contacts lose connection with the battery terminals in the battery bay, the Bluetooth module turns Off.

3. Insert a fully charged battery into the battery bay, making sure the battery terminals enter the battery bay at the right side of the battery opening. Use the direction of the arrow on the battery label as a guide.

4. Press down on the battery until it is seated in the battery bay and close the battery bay hatch cover. Slide the battery latch to the left to secure the battery in the Bluetooth Module.
5. The Bluetooth module beeps (short low tone beep, long low tone beep, long high tone beep) and the LED flashes.

Note: Do not use a metal object, or extreme force, to remove a battery from the module.

Module Battery Help

If a ring scanner is tethered to the Bluetooth module while a battery is being replaced and there is no beep or LED flash, remove the battery, turn it over and reinsert, making sure the battery terminals enter the battery bay to the right. Slide the battery bay latch to the left to secure the battery in the Bluetooth Module. If there is sufficient power in the battery, the Bluetooth module emits a series of beeps (short low tone beep, long low tone beep, long high tone beep) and the LED flashes.

Battery

Note: Connect the Ring decoder to the Bluetooth Module before inserting a battery into the module. The Bluetooth Ring Scanner module performs initialization with the ring device on bootup.

The spring-loaded rechargeable lithium-Ion battery pack in the Bluetooth ring scanner module can be replaced using one hand. No special tools are needed. A single bay spare battery charger and an eight bay battery multi-charger are available.

The Bluetooth ring scanner module does not have a power or on-off switch. When the battery is installed, the unit and its accessories are On. Remove the battery to power down or turn off the unit.

The batteries are recharged using the Bluetooth Ring Scanner Battery Charger.

Battery Condition

The 3.7V, 750mAhH Li-Ion battery in the Bluetooth module is designed to power the Bluetooth module for 8 hours and remain in standby for approximately 24 hours.

Battery Low

When a battery low condition exists, for best results the battery should be hotswapped with a fully charged battery as soon as possible.

The Ring Scanner Amber LED indicates a battery low condition by blinking for .25 seconds every 5 seconds until a Battery Dead condition occurs or the battery is replaced with a fully charged battery.

The Bluetooth module beeper indicates a battery low condition by emitting 4 short high beeps until the battery is replaced or a Battery Dead condition occurs.

Battery Dead

The Bluetooth module is Off.

It reboots after a fully charged battery is inserted.

Bluetooth Module Reboot Sequences

Suspend

To improve battery life, the Suspend timeout can be adjusted by scanning the bar codes in the Bluetooth Module Programming Bar Codes, section titled [Set Suspend Timeout](#).

Suspend begins if the Suspend timeout occurs before the scanner trigger is pressed.

A trigger pull is required to wake the module from Suspend. The module is ready to receive bar code data.

Note: After the trigger pull (to wake the module from Suspend) another trigger pull is needed to scan a bar code.

If the module is in master mode and the Reconnect Timeout period expires, a scanner trigger press resets the Reconnect Interval timer and the Reconnect Timeout timer.

Reboot

Remove the battery. Replace the battery. Do not press the ring scanner trigger or press it for less than 30 seconds.

The previously stored configuration parameters are restored.

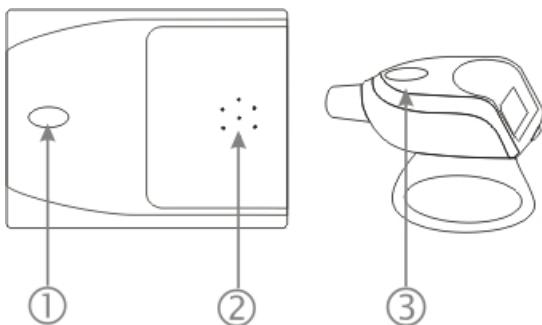

Reset

Remove the battery.

Replace the battery while pressing the ring scanner trigger for 30 or more seconds.

The factory default configuration is restored.

Status LED and Beep Indicators

1. Module LED
2. Module Beeper
3. Ring Scanner LED

The ring devices do not have the ability to emit a good decode read sound (after a bar code scan) or bad decode read sound. The Bluetooth Ring Scanner module emits the good read or bad read sounds. The module and the ring devices have an LED.

Note: Rejected bar codes generate a bad scan beep and/or an LED light sequence. In some cases, the receipt of data from the ring scanner triggers a good scan beep from the Bluetooth module, and then the rejection of scanned bar code data by the paired mobile device (e.g. MX8) processing causes a bad scan beep from the paired mobile device (MX8) on the same data.

Please see the mobile device specific guide for an explanation of the LED and beep indicators for the paired device. For example, if you have paired the Bluetooth Ring Scanner with the Thor VM1 so it can manipulate the scanned bar code data received from the Bluetooth Ring Scanner, refer to the *Thor VM1 Reference Guide* for Thor VM1LED and beep explanations.

Note: Bluetooth device connection (or pairing) can occur at distances up to 32.8 ft (10 meters) Line of Sight. Distances greater than the Line of Sight limit will break the connection. Arriving at the limit may cause unexpected beep and/or LED indications. When the connection is broken, the Bluetooth Ring Scanner module attempts to reconnect with a previously paired device for 30 seconds. Move the Bluetooth Ring Scanner Module closer to the target and a disconnected paired device will beep on reconnect.

Bluetooth Module Beep Indicators

Note: *Bluetooth device connection (or pairing) can occur at distances up to 32.8 ft (10 meters) Line of Sight. Distances greater than the Line of Sight limit will break the connection. Arriving at the limit may cause unexpected beep and/or LED indications. When the connection is broken, the Bluetooth Ring Scanner module attempts to reconnect with a previously paired device for 30 seconds. Move the Bluetooth Ring Scanner Module closer to the target and a disconnected paired device will beep on reconnect.*

The Bluetooth Module blue LED and Buzzer indicate status as follows:

Blue LED	System Condition	Indication
Fast blink, 0.25 sec. duration every 1.0 sec.	Radio Failure	Short high tone beep Short high tone beep Short low tone beep Short low tone beep
Fast blink, 0.25 sec. duration every 1.0 sec.	Pairing Failed	Short low tone beep Short high tone beep Short high tone beep Short low tone beep
Slow blink, 0.25 sec. duration every 4.0 sec.	Successful Connection	Short low tone beep Short high tone beep (When “Beep on Connect” is enabled. See Module Programming Bar Codes)
Fast blink, 0.25 sec. duration every 1.0 sec.	Lost Connection	Short high tone beep Short low tone beep (When “Beep on Connect” is enabled. See Module Programming Bar Codes)
Slow blink, 0.25 sec. duration every 4.0 sec.	Connected	None
Fast blink, 0.25 seconds every 1.0 second	Not Connected	None
Off	Suspend or Off (not tethered or no battery power available in Bluetooth Module)	None
Blue	Bluetooth Module firmware is updating	None
Off	Bluetooth Module firmware update is completed	Module restarts and power-up beep occurs
Fast Blink, 0.25 sec duration every 0.5 sec.	Communication Error	None
None	Beep on <BEL> error	Three Short low tone beeps
None	Power Up	Short low tone beep Long low tone beep Long high tone beep

Bluetooth Ring Imager LED and Ring Scanner LED

Note: *Bluetooth device connection (or pairing) can occur at distances up to 32.8 ft (10 meters) Line of Sight. Distances greater than the Line of Sight limit will break the connection. Arriving at the limit may cause unexpected beep and/or LED indications. When the connection is broken, the Bluetooth Ring Scanner module attempts to reconnect with a previously paired device for 30 seconds. Move the Bluetooth Ring Scanner Module closer to the target and a disconnected paired device will beep on reconnect.*

The ring decoding devices do not have the ability to emit a good read or bad read sound.

The Ring Scanner indicates status as follows:

LED	System Condition	Bluetooth Module Beep Sequence
Green	User Good Scan	Short high beep
Green	Configuration Good Scan This means the configuration process is successful	Three Short high beeps
Red	Scan in progress	None
Red	Configuration Bad Scan This means the configuration process has failed	Three Short low beeps
Slow blink Amber, once every .25 sec.	Low Battery in the Bluetooth Module	Four Short high beeps
Off	Suspend or Off (not tethered or no battery power available in Bluetooth Module)	None

Pairing Bluetooth Devices

When the Bluetooth Ring Scanner module pairs with another Bluetooth device, it means the Bluetooth Ring Scanner module can send serial data to the other Bluetooth device.

Note: Bluetooth Ring Scanner module paired data is stored in non-volatile memory in the module and data is saved over power cycles. Paired devices automatically reconnect when power is applied.

Bluetooth MAC ID Bar Code Label

Locate the bar code label, similar to the one shown above, attached to the Bluetooth capable mobile device, for example, the MX8. It may be on any side of the device.

The label is the Bluetooth address identifier for the Bluetooth capable mobile device. It must be scanned before pairing connection can occur.

The bar code label on the Bluetooth Ring Scanner module is a bar code and numeric representation of the MAC ID of the module.

Scan Pairing Bar Code Help

The MAC ID bar codes on some Bluetooth capable mobile devices are quite small. If you are unsuccessful using the ring imager when scanning a MAC ID bar code, change the ring imager's default Smart Focus Mode to Near Focus by scanning the [Enable Near Focus](#) bar code. Ensure focus mode is changed back to the default value of Smart Focus after the MAC ID bar code read is successful.

Note: The Bluetooth module MAC ID label should remain protected from damage (rips, tears, spills, soiling, erasure, etc.) at all times.

Bluetooth Devices

Method 1

Using the Bluetooth Ring Scanner assembly, scan the pairing bar code (Bluetooth MAC address of the device) on the Bluetooth device (e.g. handheld or vehicle mount unit).

The Bluetooth Ring Scanner module initiates the pairing process with the Bluetooth device and the devices are paired. The Bluetooth Ring Scanner module's Bluetooth LED flashes every 4 seconds. This is the recommended method for pairing.

Note: An unpaired Bluetooth Ring Scanner will re-pair with the last device to which it was paired when it scans a regular (non-pairing) bar code. If the last paired device is not available, then the Bluetooth Ring Scanner will remain unpaired. In this case, scanning a regular bar code is equivalent to scanning the pairing bar code of the last device. The Bluetooth Ring Scanner will try and, if it fails, will remain unpaired. If the pairing succeeds, the data from the regular bar code is discarded.

Method 2

Using the ring scanner attached to the Bluetooth Ring Scanner module, and the bar codes in Chapter 2 Bluetooth Module Programming, scan the Pairing Status > Enable Slave Mode bar code.

Using the Bluetooth device (e.g. handheld or vehicle mount unit) access the LXEZ Pairing control panel by tapping the Bluetooth icon on the Desktop (or the Taskbar or the Control Panel).

Open the Bluetooth Devices panel. Tap the Discover button to discover nearby Bluetooth scanners and printers. Identify the scanner you wish to pair with by matching the Friendly name (LXE Scanner – [MAC ID]) with the MAC address label on the scanner. Doubletap the Friendly Name and select Pair as Scanner from the drop-down menu. Close the LXEZ Pairing application.

Notes:

- Assumption is that the Bluetooth scanner parameters are at the factory defaults for the scanner.
- When users can use any mobile device with any scanner -- When returning from a break or at the beginning of a shift all users should pair a scanner with their mobile device using either of the methods shown above.
- When the scanner and mobile device pair successfully, the Scanner Wedge automatically sets Wedge Port 1 to be used by Bluetooth. If the mobile device is equipped with other integrated or tethered scanners, they must be configured to use a Scanner Wedge Port other than Port 1 if they are to be used when a Bluetooth scanner is paired.
- When the Bluetooth Ring Scanner is paired to a device using a Bluetooth driver other than LXEZ Pairing, the Bluetooth scanner serial data should be managed in accordance with your other Bluetooth devices.

Generic Bluetooth Devices

1. Using the ring scanner attached to the Bluetooth Ring Scanner module, and the bar codes in Bluetooth Module Programming, scan the following bar codes:
 - Restore Factory Defaults
 - Pairing Status > Enable Slave Mode
2. Using the ring decoder and the bar codes in the ring decoder-engine-specific chapter (e.g. SE955 Laser Bar Codes) configure the ring decoder to meet the requirements of the targeted generic Bluetooth device.
3. Using the generic Bluetooth device, and the device's Bluetooth software, perform a Discovery of nearby Bluetooth devices. The Bluetooth Ring Scanner assembly is identified by the label "LXE Scanner – (MAC ID)".
4. Using the generic device's Bluetooth software, pair the devices. When the devices are paired, the Bluetooth Ring Scanner module's Bluetooth LED flashes every 4 seconds.

The generic Bluetooth device will receive serial data sent by the Bluetooth Ring Scanner module every time a bar code is read and decoded by the attached ring decoder.

Clear Paired Status

Using the Bluetooth device (e.g. handheld or vehicle mount unit) access the LXEZ Pairing control panel by tapping the Bluetooth icon on the Desktop (or the Taskbar or the Control Panel). Open the Bluetooth Devices panel. Locate the Bluetooth Ring Scanner module in the list of paired devices by comparing the MAC ID number in the list with the MAC ID bar code on the module.

Doubletap the Bluetooth Ring Scanner module icon. The right-mouse-click menu appears. Select Disconnect. When the icon is red, select Delete. All devices in the Bluetooth Devices panel can be cleared (deleted) in this manner, if necessary.

The deleted Bluetooth Ring Scanner module is excluded from the list the next time the Bluetooth Devices panel is opened.

If you cannot disconnect/delete the Bluetooth Ring Scanner module from the generic device at the end of the work day, please contact your System Administrator for assistance.

Factors That May Impact Scanner Performance

Successful scanning range of a bar code decoder is dependent upon many outside influences including size of the bar code, quality of the bar code printing, material the bar code is printed on, condition of the scan lens (scratches) and angle of the beam aperture relative to the bar code label. Any of these factors may result in having to re-scan the label from a different distance or angle.

Bar Code Quality

Check the bar code for marks or physical damage e.g. ripped label, missing section, correct size for the scanner being used, etc.

In general, the bigger the bar code the further the distance from which it can be read. If the bar code is smaller than the specified size for the scanner being used, the distance, in almost all cases, will shrink.

Large bar codes can be scanned at the maximum distance. Hold the scanner closer to small bar codes (or with bars that are very close together).

Note: Do not position the scanner exactly perpendicular to the bar code being scanned. In this position, light can bounce back into the scan aperture, and possibly prevent a successful decode.

Bar Code Source

Using a graphics program to clip/copy a bar code from an online file (e.g. Adobe, Word) will copy the bar code at your monitor's dot per inch setting, a level too low for successful bar code scanning.

Copy a Bar Code -- Use your browser's right-click menu to download an individual bar code using the Save Picture As option. Save the picture to a location on your computer's hard drive. The individual bar code can be added, as a file, to any delivery vehicle e.g. email, Word document.

Bar Code Symbology

Bar codes such as UPC codes and Code 128 are more complex than Code 39 and Interleaved 2 of 5. When attempting to get the maximum read distance possible, particularly with reflective labels, use Code 39. The use of Code 128 or other more complex symbologies will almost always result in a reduction in maximum read distance. Scanner maximum distances (from Decode Zones) when symbologies other than Code 39 are used are not supported.

Lens Damage

A scratched scan beam aperture can impact read rates and distances. Beam apertures should be inspected frequently, particularly if scanning quality or distances get worse over time.

Ambient Lighting

High ambient conditions, particularly outdoor environments, will produce enough light to somewhat "blind" the scanner. This will result in shorter read distances.

Temperature

While small deviations from room temperature will have no impact on scanner performance, severe conditions like those found in freezers will have a negative impact on both the distance scanners can read and the speed the read is acquired.

Some scanner engines contain protection circuitry that shuts the scanner down in temperatures that exceed the recommended operating temperature.

Bar Code Help

Notes

- Decrease decode time by disabling unused bar code types. The scan engine can store several different bar code symbologies at the same time. This means the Bluetooth Ring Scanner is able to scan a Code 39 bar code, then an Interleaved 2 of 5 bar code, then a different bar code without requiring a parameter reset.
- The mobile device Scanner (or Data Collection Wedge) panel parameters are applied to the data resulting from successful bar code scans sent to the host (e.g. MX9, VX6) for processing. The wedge panel does not affect or change the programming bar code parameter settings in this guide.
- After scanning the Reset All to default (or equivalent) bar code with the tethered ring scanner, the next step is to open the Scanner (or Data Collection Wedge) panel on the host (e.g. MX9, VM1), click the OK button and then close the panel. This action will synchronize all scanner formats.

Printing Bar Codes

Problem

Bar codes on the printed page are too compact to be scanned, especially with a long range scanner.

Solution - Printing Adobe Acrobat PDF File Pages

When printing pages from an Adobe Acrobat PDF file, there is a difference between laser printer types and how they handle some Adobe Acrobat print functions – specifically, the “shrink to fit” option on the Print Options screen.

Before clicking Print, make sure the “Shrink oversized pages to paper size” checkbox is unchecked. If the bar code is still too small to be read by the scanner engine, run the printed page through the laser printer again using the laser printer’s Zoom feature until the bar code is large enough to scan satisfactorily.

When printing pages from an on-line Web page, run the printed page through a laser copier using the laser copier’s Zoom feature until the bar code is large enough to scan satisfactorily.

Solution - Printing from a Browser Page

Print a Page

Use the Print button on the Taskbar. Bar codes must be printed at 600 dots per inch (dpi) before they can be successfully scanned with a bar code reader.

Copy a Bar Code

Use your browser’s right-click menu to download an individual bar code using the Save Picture As option. Save the picture to a location on your computer’s hard drive. The individual bar code can be added, as a file, to any delivery vehicle e.g. Word document, e-mail.

Using the browser Edit/Copy and Edit/Paste functions to copy the bar codes on these pages will copy and paste the bar code at your monitor’s dot per inch setting, a level too low for successful bar code scanning.

Miscellaneous Programmable Bar Codes

Note: Ring decoding devices do not have the ability to emit a good read or bad read sound.

Beep After Good Decode

Audible scan progress indicators are generated by the scanner driver on mobile devices, not the bar code decoder engine. Use the Windows wedge panel options to set up the mobile device audible indicators.

Beeper Frequency Adjustment

Audible scan progress indicators are generated by the scanner driver on mobile devices, not the bar code decoder engine. Use the Windows wedge panel options to set up the mobile device audible indicators.

Beep on <BEL>

This parameter is enabled on the Bluetooth Ring Scanner Module. There is no corresponding ring scanner programming bar code required.

This parameter is disabled/inactive on host mobile devices.

Beeper Tone / Beeper Volume

Audible scan progress indicators are generated by the scanner driver on mobile devices, not the bar code decoder engine. Use the Windows wedge panel options to set up the mobile device audible indicators.

Event Reporting

Mobile devices aren't designed to process events triggered by a bar code decoder engine. Events are processed by the operating system resident on the mobile device. Use Windows Control Panel options to set up the mobile device event reporting parameters.

LED Mode

This parameter is disabled/inactive as the scan LEDs are controlled by the scanner driver, not the scanner engine.

Return to Factory Default Settings

Choose one of the following methods to restore factory defaults in the module:

- Scan the [Restore Factory Defaults bar code](#).
- To physically reset the module to factory default settings, remove the battery. Replace the battery while pressing the ring scanner trigger for 30 or more seconds and the factory default configuration is restored.

Important: After resetting the module to factory default settings, the next step is to open the bar code wedge panel on the host mobile device collecting the scanned data. Click the OK button to close the panel. This action will synchronize all scanner formats.

Removing / Replacing the Trigger Module

Equipment Needed: Phillips screwdriver with a blade diameter of 1/8" (.4mm). Not supplied.

Caution: Do not perform the following procedures if the ring bar code reader is tethered to a Bluetooth module containing a battery. There is a possibility the Scan button may be pressed inadvertently and the laser beam emitted.

Note: Do not touch, push on or brace your finger against the scan aperture at any time.

Installing and removing accessories should be performed on a clean, well-lit surface. When necessary, protect the work surface, the mobile device, and components from electrostatic discharge.

A 20-pak of full Trigger assemblies is available. Contact [Technical Assistance](#) for the latest updates and accessories.

Remove Finger Strap Assembly

Fold the flexible liner back until the screw hole is visible.

1. Rotate the trigger module until the black screw is visible.
2. Using a Phillips screwdriver with a blade diameter of 1/8" (.4mm) loosen the black screw counter-clockwise and set the screw aside in a safe place.
3. Remove the trigger module.

Step 1 : Rotate Trigger Module and Remove Screw

Step 2 : Rotate Trigger Module again until it pops up. Remove the trigger module.

Replace Trigger Module

1. Position the trigger module on the base of the Ring Scanner, making sure the empty screw hole is visible.
2. Find the tiny black screw that you removed previously.
3. Using a Phillips screwdriver with a blade diameter of 1/8" (.4mm) rotate the black screw clockwise until the trigger module is secured to the ring scanner.
4. Install the finger strap.

Removing / Replacing the Ring Finger Strap Assembly

Note: Do not pull on the finger strap or the flexible liner to remove the finger strap assembly. This quick disconnect function is designed for occasional safety hazards and is not intended for daily removal.

Using the Quick Disconnect Function, grasp the finger strap and pull the finger strap out and away from the ring scanner.

Before attaching the finger strap to the trigger module, thread the finger strap first through the hinge, then under and over the pin next to the scan button.

It should slide easily.

Cleaning the Beam Aperture

Keep fingers and rough, sharp or abrasive objects away from the beam aperture.

If the aperture becomes soiled or smudged, clean only with a standard household cleaner such as Windex® without vinegar or use Isopropyl Alcohol.

Do not use paper towels or harsh-chemical-based cleaning fluids since they may result in damage to the aperture surface. Use a clean, damp, lint-free cloth. Do not scrub optical surfaces.

If possible, clean only those areas which are soiled. Lint/particulates can be removed with clean, filtered canned air.

Bluetooth Module Firmware Update

Prerequisites: BlueCore Device Firmware Update program loaded on a desktop/laptop PC. Refer to section titled “[BlueCore Device Firmware Update Installation Instruction](#)” for instruction.

Bluetooth Module Firmware update cable (8650A051CBLBTUPDATE)

Firmware update file (Contact [Technical Assistance](#) to obtain the latest Bluetooth Module firmware update file).

A Bluetooth Module and a fully charged battery.

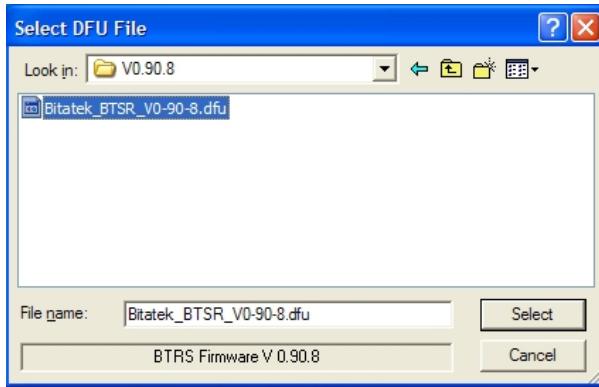

Update the Module Firmware

1. Remove the battery pack from the Bluetooth Ring Scanner module.
2. Disconnect the ring scanner cable.
3. Connect the USB end of the firmware update cable to a PC and then insert the I/O end of the firmware update cable in the I/O connector on the Bluetooth module.
4. Insert a fully charged battery pack into the Bluetooth Module. The module powers up (multiple beeps and the blue LED begins flashing).
5. Bluetooth Module Firmware Update is ready to begin
6. Click Start > All Programs and start the BlueCore Device Firmware Update Wizard application.
7. Click Next to begin the upgrade process.
8. Select how the Bluetooth module is connected to your PC by choosing the Universal Serial Bus (USB) connection type.
Click Next to continue.

9. Select Download a new version of the firmware, saving a copy of the current version first. Any previous version will be replaced.

-
10. Browse to and highlight the latest firmware upgrade file. The file has a DFU extension. Click Select to continue.

11. The upgrade process proceeds and ends with a Successful Upgrade message (see below). The Bluetooth module may emit a series of beeps or the blue LED may stop flashing and remain illuminated until the upgrade is finished.

12. Click Finish.
13. Remove the battery pack from the Bluetooth Module again.
14. Remove the firmware update cable from the I/O port.
15. At this point, the PC is ready to upgrade the next Bluetooth module, if desired.

Firmware Update Help

If the firmware update is interrupted due to loss of power or by removing the cable before the update is complete, the original firmware will be destroyed and the Bluetooth Ring Scanner will not be able to run in normal operation mode. If this event occurs the utility on the PC indicates that the firmware upgrade was not successful.

This condition can be recovered by repeating the firmware update procedure.

Chapter 2: Bluetooth Module Programming Bar Codes

Note: *Bar codes in this section are designed to be read by the ring scanner or ring imager connected to the Bluetooth Ring Scanner module.*

Introduction

This section contains programming bar codes to be used when programming the Bluetooth [module](#) only. The bar codes were created using Code 128 ASCII.

An asterisk (*) next to an option indicates the default setting.

Honeywell scanners and imagers are setup to read Code 128 bar codes by default.

- The [ring scanner](#), that is a part of the Bluetooth Module, has an SE955 scan engine. Use [SE955 Ring Scanner programming bar codes](#) to program the ring scanner engine parameters.
- The [ring imager](#), that is a part of the Bluetooth Module, has an SE4400 scan engine. Use [SE4400 Ring Imager programming bar codes](#) to program the ring imager scan engine parameters.

Preparation

Assemble the Bluetooth Ring Scanner components:

- Connect the Ring decoder to the Bluetooth Module before inserting a battery into the module. The Bluetooth Module performs initialization with the Ring Scanner on bootup.
- A fully charged battery must be secured in the battery well.
- Ring scanner or ring imager can be tethered to the Bluetooth module. Either ring device can be used to read the module programming bar codes in this section.

When parameters are changed, and saved to memory, the Bluetooth module LED blinks. Bar codes cannot be scanned until the LED color returns to normal mode.

The scan engine manufacturer may offer more bar codes and options than are contained in this guide. Please note that the bar codes in this guide are only those supported by Honeywell and the imagers or scanners linked to mobile devices that Honeywell manufactures or supports. Contact [Technical Assistance](#) if you need assistance when using the bar codes in this guide.

Module Programming Bar Codes

To change a parameter value scan the appropriate bar code in this section. The new value replaces the standard default value in memory.

An asterisk (*) next to an option in this section indicates the default setting.

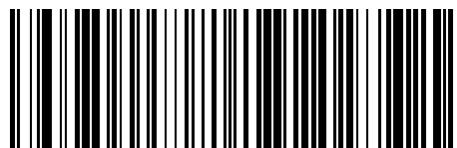

Bluetooth Module Factory Default Settings	
Slave Mode	Enabled
Suspend Timeout	5 minutes
Beep on Reconnect	Enabled
Reconnect Interval Timeout	30 seconds
Reconnect Timeout	1 minute
Role Switching	Enabled
Authentication	Disabled
Encryption	Disabled
PIN Code	16 zeros
Friendly Name	“LXE Scanner” + Module MAC address
Ring Imager Focus Mode	Smart Focus
Volume	High

Note: *Imager White LEDS programming bar codes have been replaced by the Ring Imager Programming bar codes in Decoding Illumination and LED Illumination.*

Restore Factory Defaults

Scan this bar code to restore factory defaults in the Bluetooth Ring Scanner module.

Restore Factory Defaults

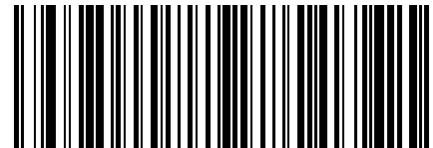

Module Firmware Version

Prerequisite: Bluetooth Ring Scanner module is fully assembled (battery, ring decoder) and connected to a device with a video display.

Scan this bar code, with either the ring scanner or the ring imager, to view the firmware version of the Bluetooth Ring Scanner module on the host device display.

Module Firmware Version

Note: If there is an issue with viewing the Bluetooth Ring Scanner module version on the connected Windows device display, open Notepad or Wordpad first, make sure the cursor is in the open file, then scan the Module Firmware Version bar code.

Pairing Status

Scan the bar code to enable pairing in Slave Mode for the Bluetooth module. Upon a successful scan, the Bluetooth module then disconnects from the paired device, deletes any saved or current pairing information and transitions into slave mode.

When pairing as Master device is successful, the module emits a pattern of a short low beep and a short high beep and the Blue LED blinks slowly, every 4 seconds.

When pairing as Master device is unsuccessful, the module emits a pattern of short low, short high, short high and short low beeps and the blue LED blinks fast, every 1 second.

* Enable
Slave Mode

LnkB00440fd01020 - Sample

Enable/Pair
as Master

SAMPLE LnkB BAR CODE – DO NOT SCAN. Scan the LnkB bar code on the Bluetooth capable mobile device (e.g. MX8) and the Bluetooth module is set to Master Mode. Slave mode is disabled.

Note: Contact [Technical Assistance](#) if the LnkB bar code is missing from the Bluetooth capable mobile device. Refer to the device specific reference guide (e.g. MX8 Reference Guide) for LnkB bar code instruction.

See Also: [Role Switching parameter](#).

Note: The LnkB bar codes on some Bluetooth capable mobile devices are quite small. If you are unsuccessful using the ring imager when scanning a LnkB bar code, change the ring imager's default Smart Focus Mode to Near Focus by scanning the [Enable Near Focus](#) bar code. Ensure focus mode is changed back to the default value of Smart Focus after the LnkB bar code read is successful.

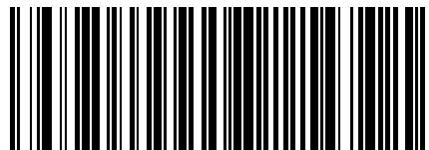

Suspend Timeout

To improve battery life, the Suspend timeout can be adjusted by scanning the following bar codes.

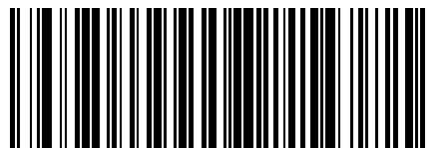

A trigger press is required to wake the module from Suspend.

Note: After the trigger press (to wake the module from Suspend) another trigger press is needed to scan a bar code.

Disable Suspend Timeout

Set Suspend Timeout to 15 seconds

Set Suspend Timeout to 30 seconds

Set Suspend Timeout to 1 minute

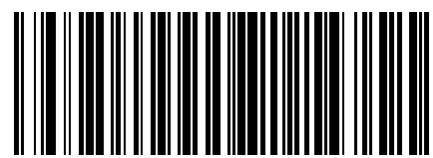

* Set Suspend Timeout to 5 minutes

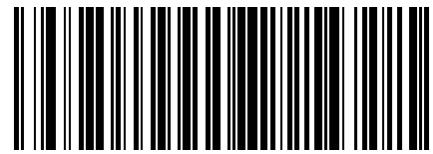

Set Suspend Timeout 15 minutes

Set Suspend Timeout to 30 minutes

Set Suspend Timeout to 45 minutes

Set Suspend Timeout to 60 minutes

Beep on Reconnect

When Beep on Reconnect is enabled and reconnect is successful, the module emits a pattern of a short low beep and a short high beep and the Blue LED blinks slowly, every 4 seconds.

When Beep on Reconnect is disabled and reconnect is unsuccessful over the reconnect interval, the module emits a pattern of a short high beep and a short low beep and the blue LED blinks fast, every 1 second.

Scan the Disable Beep on Reconnect to disable audible notification for connect and disconnect.

See Also: [Reconnect Interval Timeout](#).

* Enable Beep on Reconnect

Disable Beep on Reconnect

Reconnect Interval Timeout

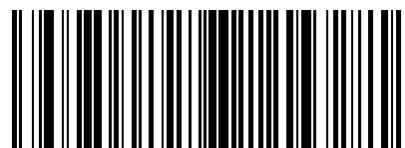

Scan one of the following bar codes to set the amount of time between attempts to reconnect with a previously connected Bluetooth enabled device.

See Also: [Beep on Reconnect](#)

Reconnect Interval Timeout 15 seconds

* Reconnect Interval Timeout 30 seconds

Reconnect Interval Timeout 45 seconds

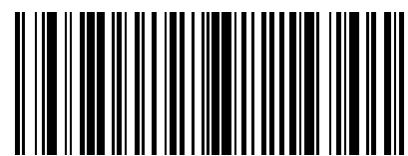

Reconnect Interval Timeout 1 minutes

Reconnect Interval Timeout 5 minutes

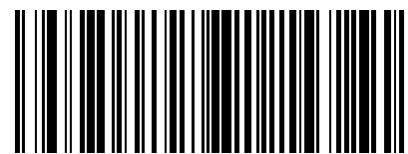

Reconnect Interval Timeout 10 minutes

Reconnect Interval Timeout 15 minutes

Reconnect Interval Timeout 30 minutes

Reconnect Timeout

Scan one of the following bar codes to set the amount of time the Master device will retry connection attempts before ceasing attempts.

When the parameter is set to Off, reconnect attempts will continue until the battery in the Bluetooth module is depleted.

See Also: [Beep on Reconnect](#)

Reconnect Timeout Off

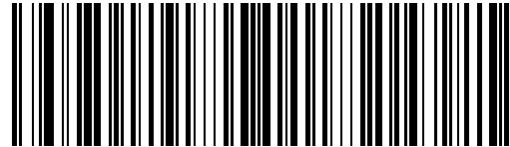

* Reconnect Timeout 1 minute

Reconnect Timeout 5 minutes

Reconnect Timeout 30 minutes

Reconnect Timeout 60 minutes

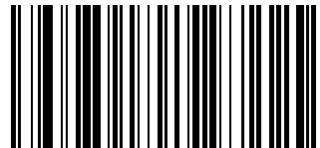

Role Switching

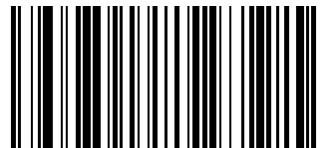

When Role Switching is enabled and the module has successfully paired with an Bluetooth capable mobile device as a master, the module will perform role switching with the mobile device and become a slave device.

See Also: [Enable Slave Mode](#)

* Enable Role Switching

Disable Role Switching

Authentication

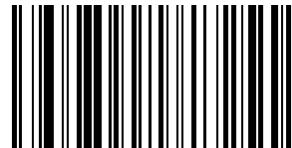

Authentication is the process of verifying the identity of a device with which a connection is to be established.

When Authentication is disabled, any device can connect to the Bluetooth Ring Scanner module.

When Authentication is enabled, the connecting device is required to enter the PIN value set by the Bluetooth Ring Scanner module before successful connection can occur.

See Also: [Set PIN Code and PIN Code Default](#)

Enable Authentication

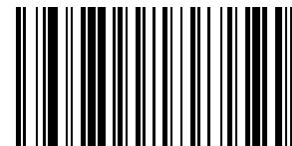

* Disable Authentication

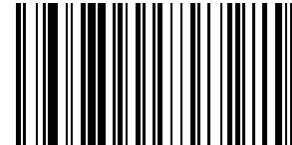

Encryption

Encryption is the process of encoding data for transmission between devices to ensure its integrity.

Enable Encryption

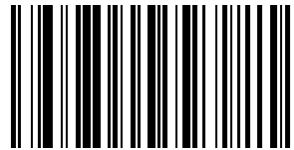

* Disable Encryption

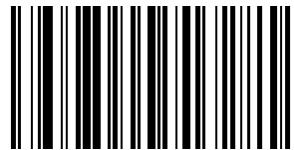

Beep Volume

The Bluetooth Module speaker volume can be reset by scanning one of the following bar codes.

Volume Off

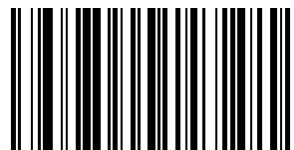

Volume Low

Volume Medium

* Volume High

Ring Imager Focus Mode

Note: This parameter is to be used for the ring imager connected to the Bluetooth Ring Scanner module only. The ring scanner will ignore this parameter if it scans it in error.

Select a focus mode to control the working range of the imager.

- When Far Focus is selected, the imager is optimized to read at its far position.
- With Near Focus, the imager is optimized to read at its near position.
- Smart Focus toggles the focus position after every frame. There may be audible signals emitted from the module as Smart Focus toggles after every frame.

Refer to the SE4400 Scan Engine Technical Specifications for typical working ranges for the Ring Imager decoder.

The focus mode persists over a power cycle (remove and replace the module battery).

This parameter reverts to the default setting after a module Reset (holding the imager trigger for 30 seconds after reinstalling the module battery).

It reverts to the default setting after the Factory Defaults bar code is scanned.

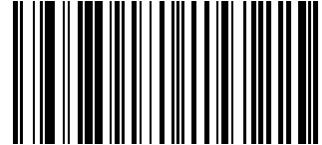

When the following Ring Imager Focus Mode parameter **is not** scanned but the Focus Mode parameter in chapter titled *SE4400 Imager Bar Codes* **is** scanned, the Ring Imager Focus Mode setting reverts to Smart Focus Mode after a power cycle.

Scan the appropriate bar code below:

* Ring Imager Smart Focus Mode

Ring Imager Far Focus Mode

Ring Imager Near Focus Mode

Enter Friendly Name or PIN Code

PIN Code

1. Scan the Set PIN Code bar code, then scan up to 16 alphanumeric characters to set the Bluetooth module PIN Code.
2. Scan the numbers, lowercase alpha and uppercase alpha bar codes [here](#).
3. When finished entering all characters, scan the Stop PIN Code setup bar code.
4. Scan the Stop PIN Code setup bar code to end PIN Code data entry.

The PIN Code default value is 16 zeros.

To reset the Pin Code back to the default, scan the Set Pin Code bar code and the Pin Code Default bar code only.

Set PIN Code

Pin Code Default

Stop PIN Code setup

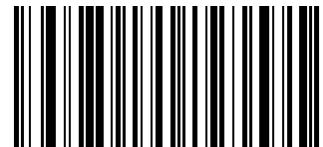

Friendly Name

1. Scan the Set Friendly Name bar code, then scan up to 32 alphanumeric characters to set the Bluetooth module Friendly Name.
2. Scan the numbers, lowercase alpha and uppercase alpha bar codes [here](#).
3. When finished entering all characters, scan the Stop Friendly Name setup bar code to end Friendly Name data entry.

The Friendly Name default value is “LXE Scanner” + MAC address in Hexadecimal.

The Friendly Name can be viewed using LXEZ Pairing on the paired mobile device.

Chapter 3: Symbol Laser Scanner Programming Bar Codes

Note: These bar codes, explanations and instructions are for programming the Symbol laser scanner engine in your ring scanner. Please do not scan the bar codes in this section with any other imager or laser engine.

Introduction

Note: A ring scanner does not have beep / audio capability.

Assumption: The user is familiar with Windows on-screen functions.

Scan engine manufacturers may offer more bar codes and options than are contained in this chapter. Please note that the bar codes in this chapter are only those supported by Honeywell and the mobile devices it manufactures or supports. Contact [Technical Assistance](#) if you need assistance when using the bar codes in this guide.

To change a parameter value: Scan the appropriate bar code in this section. The new value replaces the standard default value in memory.

The following bar code symbologies are supported on the Bluetooth Ring Scanner:

Symbology
Chinese 2 of 5
Codabar
Code 11
Code 128
Code 39
Code 93
Discrete 2 of 5
Interleaved 2 of 5
MSI Plessey
GS1 DataBar (RSS)
GS1 Databar (RSS) and Composite Codes
UPC/EAN
UPC-A
UPC-E
UPC-E1
EAN-8
EAN-13

Aiming Modes

There are many aiming “modes” for laser bar code scanners – aiming dots, aiming patterns, aim duration, etc. All aiming “modes” concern the length of time the beam is sent out, how wide the beam is and what happens when the timer expires. The terms are used interchangeably and may be confusing for the novice bar code laser scanner user.

Note: Decoding algorithms released by the bar code engine manufacturer often change upon each new release. Programming parameters that were available at one release may not be available upon a later software release. Honeywell supports the programming bar codes for the specific engines in this guide only.

SE955 Ring Scanner

The scan engine can have its aiming beam/aiming dot setup using these bar codes:

- [Use Laser On Time](#)
- [Aim Duration](#), and
- [Scan Angle](#)

Aiming Dot Help

How to get an aiming dot when there is no “Aiming Dot” parameter: Set *Aim Duration* to .5 seconds and an aiming “dot” is sent while the scan trigger is held down. When the timer expires, the aiming beam widens and the bar code is read.

Prefix / Suffix

Ring decoder engine prefix and suffix parameters should not be set, changed, or reset using the Prefix and Suffix bar codes shown in this section. When the Bluetooth Ring Scanner Module is reset to defaults, the prefix and suffix settings revert to their default values and need to be scanned again. Use the Scanner or Data Collection control panel in the host computer to store prefix and suffix values.

Refer to the host reference guide (e.g. MX7) for information and instruction on setting up the following scanner parameters:

- Enable/Disable decoding sounds
- Imager LED Illumination
- COM1 Serial Parameters
- Code ID: AIM, Symbol, Custom
- Symbology Settings including Prefix/Suffix
- Control Character Mapping
- Custom Identifiers

Pre-Configured Default Values

Ring Scanner Parameter, 955	Default
Set Default Parameter	All Defaults
Scanning Options	
Aim Duration	0.0 sec
Aiming Mode	Not Supported
Beeper Volume	Not Supported
Bi-directional Redundancy	Disable
Laser On Time	3.0 sec.

Set Default Parameter

Restore Defaults

If custom defaults were set by scanning Write Custom Defaults, scan Restore Defaults to retrieve and restore the scanner's custom default settings. If no custom defaults were set, scan Restore Defaults to restore the factory default values.

Set Factory Defaults

Restore the factory default values. If custom defaults were set, they are eliminated.

Write Custom Defaults

Store the current scanner settings as custom defaults. Once custom default settings are stored, they can be recovered at any time by scanning the Restore Defaults bar code.

Restore Defaults

Set Factory Defaults

Write Custom Defaults

See Also: "Reset"

See [Pre-Configured Default Values](#) for an alphabetical listing of all default values.

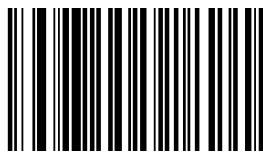

Scanner Parameters – General

Aim Duration

Note: For correct operation, reboot the mobile device after changing this value.

When a scanner with an aim mode is triggered either by a Scan button press, or a Start_Decode command, this parameter sets the duration the aiming pattern is seen before a scan attempt begins. It does not apply to the aim signal or the Aim_On command. It is programmable in 0.1 second increments from 0.0 to 9.9 seconds. No aim pattern is visible when the value is 0.0.

To **set aim duration**, scan the bar code below:

Next scan two numeric bar codes that correspond to the desired aim duration. Times less than 1.0 second must have a leading zero. For example, to set an aim duration of 0.5 seconds, scan the bar code above, [then scan the “0” and “5” bar codes](#) on the [Keypad Number Symbols](#) page. If you make an error, or wish to change your selection, scan the [Cancel](#) bar code.

Bi-Directional Redundancy

Use this parameter to decide whether a bar code is successfully scanned in both directions before being decoded.

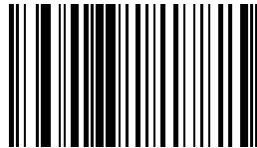

Note: This parameter is only valid when a [Linear Code Type Security Level](#) has been enabled. The default for Security Level parameter is Level 1.

Select an option by scanning either of the bar codes shown below.

Enable Bi-Directional Redundancy

* Disable Bi-Directional Redundancy

Disable All Symbologies

Scan the bar code below to disable the decoding of all symbologies. Use this to simplify selecting a single symbology to decode by scanning this bar code, then scanning the desired enable code type bar code.

Note that the decoder can still decode parameter bar codes.

Data Options

Note: SE955 ring scanner engine prefix and suffix parameters cannot be set, changed, or reset using the bar codes in this chapter. See previous section titled [Prefix / Suffix](#).

Prefix and Suffix

Ring decoder engine prefix and suffix parameters should not be set, changed, or reset using the Prefix and Suffix bar codes shown in this section. When the Bluetooth Ring Scanner Module is reset to defaults, the prefix and suffix settings revert to their default values and need to be scanned again. Use the Scanner or Data Collection control panel in the host computer to store prefix and suffix values.

Parameter Default Value:

Prefix (P)	Null
Suffix1 (S1)	LF
Suffix2 (S2)	CR

Note: Parameter “[Scan Data Transmission Format](#)” must be set before selecting Prefix/Suffix values.

A prefix and/or one or two suffixes may be appended to scan data for use in data editing. These values are set by scanning four bar codes (resulting in a four digit number) that correspond to key codes for various mobile devices. See the table titled “ASCII Character Equivalents”.

If you wish to change your selection, scan this **Data Format Cancel** bar code:

Prefix

To begin setting **Prefix** values, scan this bar code:

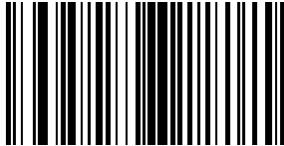

Next, scan four numeric bar codes that correspond to the computer keycode using the “[Keypad Number Symbols](#)”.

If you wish to change your selection, scan Cancel on the “Keypad Number Symbols” page.

Suffix 1

To begin setting **Suffix 1** value, scan this bar code:

Next, scan four numeric bar codes that correspond to the computer keycode using the "[Keypad Number Symbols](#)".

If you wish to change your selection, scan Cancel on the "Keypad Number Symbols" page.

Suffix 2

To begin setting **Suffix 2** value, scan this bar code:

Next, scan four numeric bar codes that correspond to the computer keycode using the "[Keypad Number Symbols](#)".

If you wish to change your numeric selection, scan Cancel on the "Keypad Number Symbols" page.

Scan Data Transmission Format

Note: Parameter “[Prefix/Suffix Values](#)” should be set after setting this parameter.

Use this option when you want to append a prefix and suffix to the decode data.

Set this parameter by scanning one of the following bar codes.

* Data As Is

[Data] [Suffix 1]

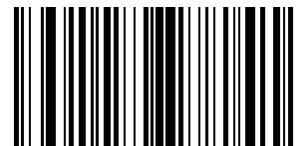

[Data] [Suffix 2]

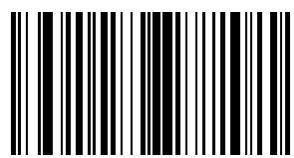

[Data] [Suffix 1] [Suffix 2]

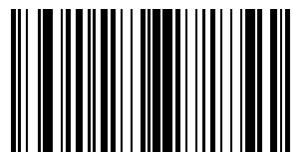

[Prefix] [Data]

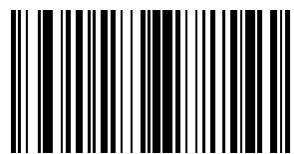

[Prefix] [Data] [Suffix 1]

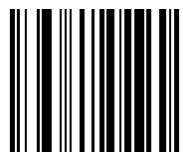

[Prefix] [Data] [Suffix 2]

[Prefix] [Data] [Suffix 1] [Suffix 2]

Cancel

Transmit Code ID Character

Parameter Default Value: None

A code ID character identifies the code type of a scanned bar code. This may be useful when the scanner is decoding more than one code type. In addition to any single character prefix already selected, the code ID character is inserted between the prefix and the decoded symbol.

Scan one of the following bar codes to select either no code ID character, a Symbol Code ID character or an AIM Code ID character.

Transmit No Code ID Character

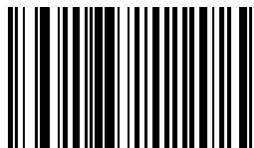

Transmit Symbol Code ID Character

A	UPC-A, UPC-E, UPC-E1, EAN-8, EAN-13
B	Code 39, Code 32
C	Codabar
D	Code 128, ISBT 128
E	Code 93
F	Interleaved 2 of 5
G	Discrete 2 of 5 or Discrete 2 of 5 IATA
H	Code 11
J	MSI Plessey
K	UCC/EAN-128
L	Bookland EAN
M	Trioptic Code 39
N	Coupon Code
R	GS1 DataBar Omnidirectional (RSS-14), GS1 Limited (RSS-Limited), GS1 Expanded (RSS-Expanded)

Transmit AIM Code ID Character

Each AIM Code Identifier contains the three character string]cm where:

] = Flag Character (ASCII 93)

c = Code Character

A	Code 39
C	Code 128
E	UPC/EAN
F	Codabar
G	Code 93
H	Code 11
I	Interleaved 2 of 5
M	MSI Plessey
S	D2 of 5, IATA 2 of 5
X	Code 39 Trioptic, Bookland EAN
e	GS1 DataBar (RSS)

m = Modifier Character

The modifier character is the sum of the applicable option values based on the following table.

Code Type	Option Value	Option
Code 39		
	0	No Check character or Full ASCII processing.
	1	Reader has checked one check character.
	3	Reader has checked and stripped check character.
	4	Reader has performed Full ASCII character conversion.
	5	Reader has performed Full ASCII character conversion and checked one check character.
	7	Reader has performed Full ASCII character conversion and checked and stripped check character.
		Example: A Full ASCII bar code with check character W,A+I+MI+DW, is transmitted as]A7AimId where 7 = (3+4).
Trioptic Code 39		

Code Type	Option Value	Option
	0	No option specified at this time. Always transmit 0.
		Example: A Trioptic bar code 412356 is transmitted as]X0412356
Code 128		
	0	Standard data packet, No Function code 1 in first symbol position.
	1	Function code 1 in first symbol character position.
	2	Function code 1 in second symbol character position.
		Example: A Code (EAN) 128 bar code with Function 1 character in the first position, FNC1 Aim Id is transmitted as]CIAimId
Interleaved 2 of 5		
	0	No check digit processing.
	1	Reader has validated check digit.
	3	Reader has validated and stripped check digit .
		Example: An I 2 of 5 bar code without check digit, 4123, is transmitted as]I04123
Codabar		
	0	No check digit processing.
	1	Reader has checked check digit.
	3	Reader has stripped check digit before transmission.
		Example: A Codabar bar code without check digit, 4123, is transmitted as]F04123
Code 93		
	0	No options specified at this time. Always transmit 0.
		Example: A Code 93 bar code 012345678905 is transmitted as]G0012345678905
MSI (Plessey)		
	0	Single check digit checked.
	1	Two check digits checked.
	2	Single check digit verified and stripped before transmission.
	3	Two check digits verified and stripped before transmission.
		Example: An MSI Plessey bar code 4123, with a single check digit checked, is transmitted as]M04123
Discrete 2 of 5		
	0	No options specified at this time. Always transmit 0.
		Example: A D 2 of 5 bar code 4123, is transmitted as]S04123
UPC/EAN		
	0	Standard packet in full EAN country code format, which is 13 digits for UPC-A and UPC-E (not including supplemental data).

Code Type	Option Value	Option
	1	Two digit supplement data only
	2	Five digit supplement data only
	4	EAN-8 data packet.
		Example: A UPC-A bar code 012345678905 is transmitted as]E00012345678905
Bookland EAN		
	0	No options specified at this time. Always transmit 0.
		Example: A Bookland EAN bar code 123456789X is transmitted as]X0123456789X

According to AIM standards, a UPC with supplemental bar code is transmitted in the following format:

]EO (UPC chars) (terminator)]E2 (supplemental) (terminator)

Therefore, a UPC with two supplemental characters, 01234567890510, is transmitted to the host as a 21-character string,]E00012345678905]E110.

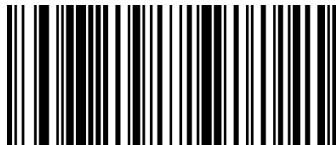

Laser On Time

Note: For correct operation, reboot the Bluetooth Ring Scanner after changing this value.

Parameter Default Value: 3.0 seconds

This parameter sets the maximum time decode processing continues during a scan attempt. It is programmable in 0.1 second increments from 0.50 to 25.5 seconds. If a label has not been decoded before this time expires and the session is terminated, the system regards it as a failed scan attempt.

To begin setting **Laser On Time**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired on time using the [Keypad Number Symbols](#) at the end of this section. Times less than 1.0 second must have a leading zero.

If you wish to change your number selection, scan Cancel on the "Keypad Number Symbols" page.

[See Also: "Laser On Time \(superseded\)"](#)

Linear Code Type Security Level (Redundancy Level)

Use this parameter to determine the security level appropriate for bar code quality. The security level indicates how many times the bar code must be successfully read by the scanner before being decoded.

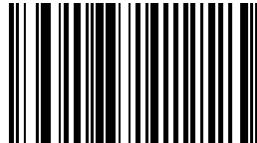

There are four security levels. Higher security levels are selected for decreasing levels of bar code quality. As security levels increase, the scanner's aggressiveness decreases.

Select an option by scanning one of the bar codes shown below. If you wish to change your selection, scan [Cancel](#).

Level 1	The following code types must be successfully read twice before being decoded: Codabar : All lengths MSI Plessey : Length of 4 characters or less D 2 of 5 : Length of 8 characters or less I 2 of 5 : Length of 8 characters or less
Level 2	All code types must be successfully read twice before being decoded.
Level 3	Code types other than the following must be successfully read two times before being decoded. The following codes must be read three times: MSI Plessey : Length of 4 characters or less D 2 of 5 : Length of 8 characters or less I 2 of 5 : Length of 8 characters or less
Level 4	All code types must be successfully read three times before being decoded.

Note: *Linear Code Type Security does not apply to Code 128.*

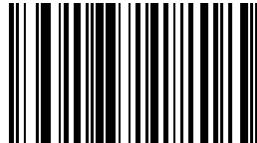

* **Level 1**

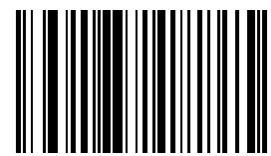

Level 2

Level 3

Level 4

Parameter Pass Through

Enable Parameter Pass Through to transmit bar codes in the following format, in Code 128, to the host:

<FNC3>L<any length data>
<FNC3>B<12 characters of data>

Note that the special Code 128 character <FNC3> must appear at the beginning of this data. However, if the appropriate data does not follow this as shown above, it does not transmit to the host device.

Enable Parameter Pass Through

* Disable Parameter Pass Through

Parameter Scanning

Use this parameter to decide whether scanner parameters can be set using the bar codes in this section.

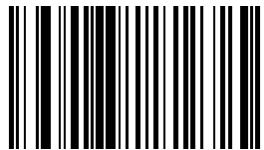

Note: When this parameter is disabled, scan the [Set Defaults](#) parameter bar code to enable parameter scanning.

When disabled, either scan the Enable Parameter Scanning bar code or the Set All Defaults bar code (or set this parameter to 01h via a serial command) to reset the parameter and bar codes in this section can then be scanned.

When enabled, scanners can be configured using the bar codes in this section.

Select a mode by scanning either of the bar codes shown below.

* Enable Parameter Scanning

Disable Parameter Scanning

Power Mode

Note: Mobile devices are designed to be operated in Low Power Mode. For best results this value should remain unchanged.

A parameter setting of Continuous On means the laser scanner will not power down until the mobile device is powered off.

A parameter setting of Low Power means the laser scanner will enter low power mode after one second of waiting for a Scan button press. Pressing the Scan button will begin the decode sequence.

Select a Power Mode by scanning either of the bar codes shown below.

Continuous On

* Low Power

Scan Angle (SE955 only)

Choose one of the options below to set the scan angle to narrow or wide. Once the parameter bar code is scanned, the Scan Angle setting is persistently stored.

Select an option by scanning one of the bar codes shown below.

Narrow Angle (35°)

* Wide Angle

See Also: "Scan Angle (SE955 only) superseded"

Simple Serial Interface (SSI) Options

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Note: Baud Rate Parameter must remain at 9600 bps at all times.

SSI Default Values

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Option	Default Value
Baud Rate	Not Supported
Beep on < BEL >	Supported
Check Parity	Not Supported
Decode Data Packet Format	Unpacketized
Host Character Time-out	200 msec
Host Serial Response Time out	2 sec
Intercharacter Delay	0
Parity	None
Software Handshaking	Enable
Stop Bit Select	1

Beep on BEL

This parameter is enabled. There is no corresponding programming bar code required.

Baud Rate

Baud rate is the number of bits of data transmitted per second. The scanners baud rate setting should match the data rate setting of the host device. If not, data may not reach the host device or may reach it in distorted form.

Baud rate should always be set to 9600. If the baud rate is set to any other value but 9600, a transmit error will occur. Either scan the 9600 bps bar code or reset the mobile device to factory default (or last saved good default) values.

Set this parameter by scanning this bar code.

9600 bps

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Decode Data Packet Format

This parameter selects whether decoded data is transmitted in raw format (unpacketized), or transmitted with the packet format as defined by the serial protocol.

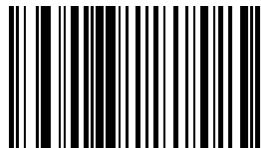

If the raw format is chosen, ACK/NAK handshaking is automatically disabled for decode data.

Set this parameter by scanning either of the following bar codes.

* Send Raw Decode Data

Send Packeted Decode Data

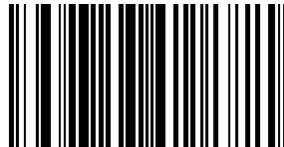

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Host Character Time-out

Host Character Time-out Parameter Default Value: 200 msec

This parameter determines the maximum time the decoder waits between characters transmitted by the host before discarding the received data and declaring an error. The time-out is set in 0.01 second increments from 0.01 seconds to 0.99 seconds. After scanning the bar code below, scan two numerical bar codes to set the desired time-out.

To begin setting the **time-out value**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value using the "Keypad Number Symbols" at the end of this chapter. Single digit numbers must have a leading zero. For example, a value of 300 msec is selected by scanning the "3" and the "0" numeric bar codes. A value of 30 msec is selected by scanning the "0" and the "3" bar codes.

If you wish to change your selection, scan Cancel on the "Keypad Number Symbols" page.

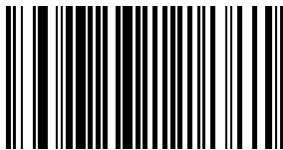

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Host Serial Response Time-out

Host Serial Response Time-out Parameter Default Value: 2 sec

This parameter determines the maximum time the decoder waits for an ACK or NAK before resending. Also, if the decoder wants to send, and the host has already been granted permission to send, the decoder waits for the designated time-out before declaring an error. The delay period can range from 0.0 to 9.9 seconds in 0.1 second increments. After scanning the bar code below, scan two numerical bar codes to set the delay.

To begin setting the **time-out value**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value using the “Keypad Number Symbols” at the end of this chapter. Time durations of less than 1.0 second require a leading zero. For example, a value of 4.5 seconds is selected by scanning the “4” and the “5” numeric bar codes. A value of 0.3 seconds is selected by scanning the “0” and the “3” bar codes.

If you wish to change your selection, scan Cancel on the “Keypad Number Symbols” page.

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Intercharacter Delay

Intercharacter Delay Parameter Default Value: 0 msec

Select the intercharacter delay option matching host requirements. The intercharacter delay gives the host system time to service its receiver and perform other tasks between characters.

The delay period can range from no delay to 99 msec in 1 msec increments. After scanning the bar code below, scan two numerical bar codes to set the delay.

To begin setting the **delay value**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value using the “Keypad Number Symbols” at the end of this chapter. Time durations of less than 1 msec require a leading zero. For example, a value of 25 msec is selected by scanning the “2” and the “5” numeric bar codes. A value of 6 msec is selected by scanning the “0” and the “6” bar codes.

If you wish to change your selection, scan Cancel on the “Keypad Number Symbols” page.

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

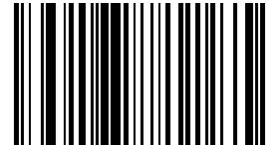

Parity

A parity check bit is the most significant bit of each ASCII coded character. Select the parity type according to host device requirements.

Set this parameter by scanning one of the following bar codes.

Odd Parity

The Odd parity bit has a value 0 or 1, based on data, to ensure that an odd number of 1 bits is contained in the coded character.

Even Parity

The Even parity bit has a value 0 or 1, based on data, to ensure that an even number of 1 bits is contained in the coded character.

Mark Parity

The parity bit is always 1.

Space Parity

The parity bit is always 0.

* No Parity

No parity is required.

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Software Handshaking

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

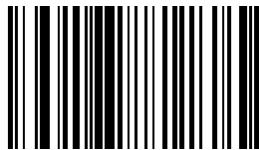

This parameter offers control of the data transmission process in addition to that offered by hardware handshaking.

Hardware handshaking is always enabled and cannot be disabled by the user.

Scan one of the following bar codes to set software handshaking.

Disable ACK/NAK Handshaking

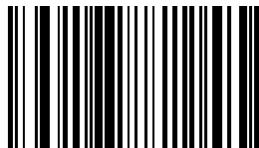

When this option is selected, the decoder will neither generate nor expect ACK/NAK handshaking packets.

* Enable ACK/NAK Handshaking

When this option is selected, after transmitting data, the scanner expects either an ACK or NAK response from the host. The scanner will also ACK or NAK messages from the host when this option is selected.

The scanner waits up to the programmable [Host Serial Response Time-out](#) to receive an ACK or NAK. If the scanner does not get a response in this time, it resends its data up to two times before discarding the data and declaring a transmit error.

Stop Bit Select

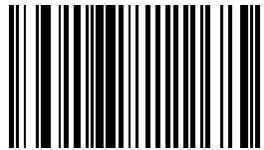

The stop bit(s) at the end of each transmitted character marks the end of transmission of one character and prepares the receiving device for the next character in the serial data stream.

The number of stop bits selected (one or two) depends on the number the receiving computer is programmed to accommodate.

Set the number of stop bits to match host device requirements.

Set this parameter by scanning one of the following bar codes.

* One Stop Bit

Two Stop Bits

The SSI Options bar codes are directed toward the host programmer when writing host/scanner interface programs for different hosts. Contact [Technical Assistance](#) for technical assistance.

Time-out Between Decodes, Same Symbol

Parameter Default Value: 1.0 second

Use this parameter to prevent the beeper from continuously beeping when a symbol is left in the scanner's field of view.

To begin setting **differing symbol timeout values**, scan this bar code:

Using the "[Keypad Number Symbols](#)" section at the end of this chapter, scan two numeric bar codes that represent the desired interval, in 0.1 second increments. Valid values are between 0.0 and 9.9 seconds. Single digit values must be predefined by a leading zero. For example, to set a timeout of 0.5 seconds, scan the Timeout/Decodes – Same bar code, then scan the number 0 and 5 bar codes.

If you wish to change your number selection, scan Cancel on the "Keypad Number Symbols" page.

Transmit “No Read / Decode” Message

Use this parameter to decide whether a message is sent to the host when a bar code symbol does not decode.

When enabled, and a symbol does not decode within either:

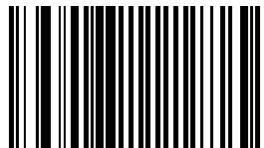

- A trigger pull activates the laser and decode processing, the processing continues until a trigger release, or
- The laser decode processing continues until the Laser On Timeout is reached.

A “NR” (No Read) is transmitted to the host. Any prefix or suffixes which have been enabled are appended around this message.

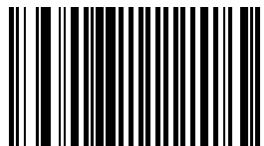

When disabled, and a symbol does not decode, no message is sent to the host.

Select an option by scanning either of the bar codes shown below.

Enable No Read

* Disable No Read

Trigger Mode

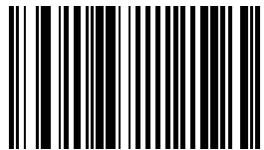

Note: The Bluetooth Ring Scanner Module with a linked scanner is designed to be operated in Host Trigger Mode. For best results leave the Trigger Mode default value unchanged for these devices.

Use this parameter to determine when the laser is activated and decoding begins, how long the laser remains on and what determines the cessation of the laser scan and decode process.

Trigger Mode	Function
Level	A trigger pull or Scan button press activates the laser and decode processing. The laser remains on and decode processing continues until a trigger release, a valid decode or the Laser On Time-out is reached.
Pulse	A trigger pull or Scan button press activates the laser and decode processing. The laser remains on and decode processing continues until a valid decode, or the Laser On Time-out is reached.
Continuous	The laser is always on and decoding. See Also Time-out Between Same Symbol
Blinking	This trigger mode is used for triggerless scanning operations. Scanning range is reduced in this mode. This mode cannot be used with scanners that support an aim mode.
Host (default)	Triggering signal comes from a host command. Any actual trigger pull or Scan button press will be interpreted by the scanner engine as a Level triggering option.

Select a trigger mode by scanning the appropriate bar code. If you wish to change your selection, scan Cancel.

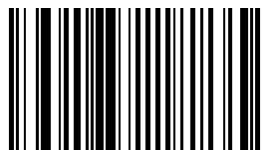

Level

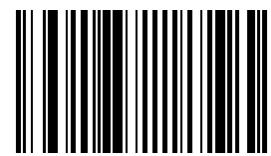

Pulse

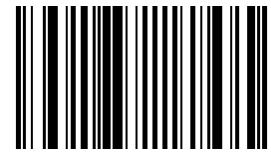

Continuous

Cancel

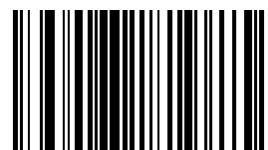

Scanner Parameters – Bar Code Type Specific

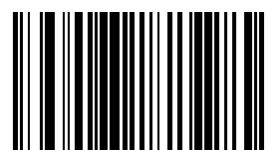

Chinese 2 of 5

When enabled, Chinese 2 of 5 symbols will be scanned, decoded and transmitted. Set this parameter by scanning either of the bar codes shown below.

Enable Chinese 2 of 5

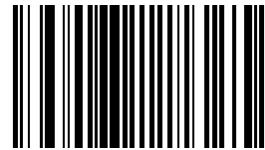

* Disable Chinese 2 of 5

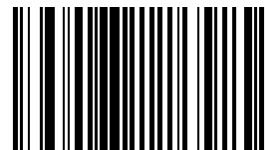

Codabar

When enabled, Codabar symbols will be scanned, decoded and transmitted. Set this parameter by scanning either of the bar codes shown below.

Enable Codabar

* Disable Codabar

CLSI Editing

When enabled, the start and stop characters are stripped from the bar code and a space is inserted after the 1st, 5th, and 10th characters of a 14 character Codabar symbol.

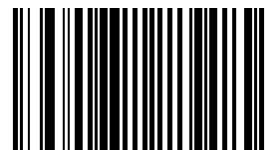

Set this parameter by scanning either of the bar codes shown below.

Note: Symbol length does not include start and stop characters.

Enable CLSI Editing

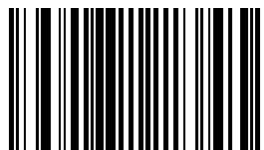

* Disable CLSI Editing

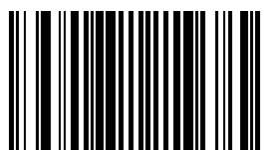

NOTIS Editing

When enabled, the start and stop characters are stripped from a decoded Codabar symbol. Set this parameter by scanning either of the bar codes shown below.

Enable NOTIS Editing

* Disable NOTIS Editing

Set Lengths for Codabar

L1 Parameter Default Value: 5

L2 Parameter Default Value: 55

Lengths for Codabar may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

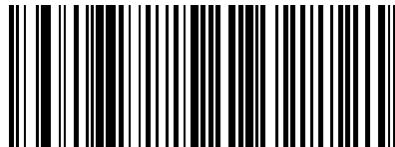

The length of a code refers to the number of characters, including check digits, the code contains. It also includes any start or stop characters.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Codabar symbols containing 14 characters, scan the “Codabar One Discrete Length” bar code and then “1” and “4” bar codes using the “[Keypad Number Symbols](#)”.

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “[Keypad Number Symbols](#)” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Codabar symbols containing 2 or 14 characters, scan the “Codabar Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the “[Keypad Number Symbols](#)” at the end of this chapter.

To begin setting **two discrete lengths**, scan this bar code:

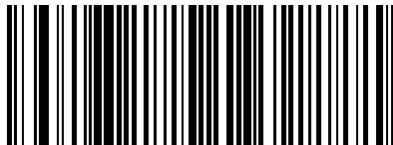

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “[Keypad Number Symbols](#)” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Codabar symbols containing between 4 and 12 characters, scan the “Codabar Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes.

To begin setting **lengths within a range**, scan this bar code:

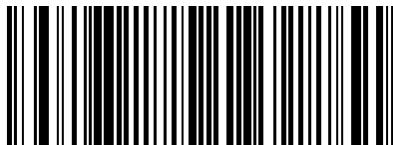

Next, scan numeric bar codes that correspond to the desired value using the “[Keypad Number Symbols](#)”. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes Codabar bar codes containing any number of characters.

To set **any length**, scan this bar code:

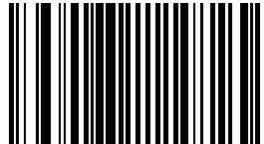

Code 11

When enabled, Code 11 symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 11

* Disable Code 11

Set Lengths for Code 11

L1 Parameter Default Value: 4

L2 Parameter Default Value: 55

Lengths for Code 11 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains. It also includes any start or stop characters.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 11 symbols containing 14 characters, scan the “Code 11 One Discrete Length” bar code and then “1” and “4” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 11 symbols containing 2 or 14 characters, scan the “Code 11 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [“Keypad Number Symbols”](#) at the end of this chapter.

To begin setting **two discrete lengths**, scan this bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 11 symbols containing between 4 and 12 characters, scan the “Code 11 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes.

To begin **setting lengths within a range**, scan this bar code:

Next, scan numeric bar codes that correspond to the desired value using the “[Keypad Number Symbols](#)”. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes Code 11 bar codes containing any number of characters.

To set **any length**, scan this bar code:

Code 11 Check Digit Verification

When enabled, this parameter checks the integrity of a Code 11 symbol to ensure it complies with the specified check digit algorithm.

Note: *Enable “Code 11 Check Digit Verification” when “[Transmit Code 11 Check Digits](#)” is enabled.*

Set this parameter by scanning one of the bar codes shown below.

* Disable this feature

One Check Digit

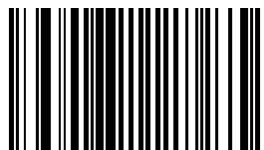

Two Check Digits

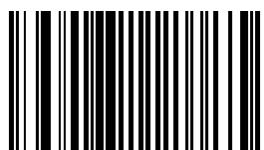

Transmit Code 11 Check Digits

Note: *Code 11 Check Digit Verification* must be enabled for this parameter to function.

Transmit (Enable)

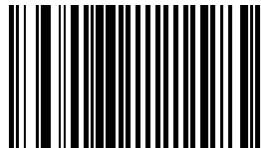

* Do Not Transmit (Disable)

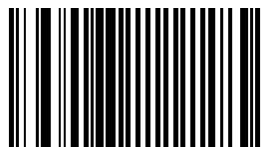

Code 128

Set this parameter by scanning either of the bar codes shown below.

* Enable Code 128

Disable Code 128

GS1-128 (formerly UCC/EAN-128)

Set this parameter by scanning either of the bar codes shown below.

* Enable GS1-128

Disable GS1-128

GS1-128 is a convention for printing data fields with standard Code 128 bar code symbols. GS1-128 symbols are distinguished by a leading FNC 1 character as the first or second character in the symbol. Other FNC 1 characters are used to delineate fields.

When GS1-128 symbols are read, they are transmitted after special formatting strips off the leading FNC 1 character, and replaces other FNC 1 characters with the ASCII 29 (GS) control character.

When AIM symbology identifiers are transmitted, the modifier character indicates the position of the leading FNC 1 character according to AIM guidelines. For example,]c1 indicates a GS1-128 symbol with a leading FNC1 character.

Standard Code 128 bar codes which do not have a leading FNC 1 may still be used, but are not encoded according to the GS1-128 convention. Standard Code 128 and GS1-128 may be mixed in an application. The SE955 autodiscriminates between these symbols, and can enable or disable one or both code types.

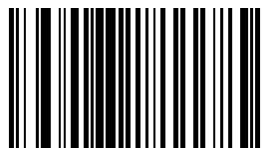

The following table indicates the behavior of the SE955 in each of the four possible parameter settings.

Standard Code 128	UCC/EAN 128	Effect and Example
Disable	Disable	No Code 128 symbols can be read.
Disable	Enable	Read only symbols with leading FNC1.
		Examples: FNC1ABCD ^{FNC1E} are read as ABCD ^{29E} A ^{FNC1BCD^{FNC1E} are read as ABCD^{29E} FNC1FNC1ABCD^{FNC1E} are read as ABCD^{29E} ABCD^{FNC1E} cannot be read ABCDE cannot be read}
Enable	Disable	Read only symbols without leading FNC1.
		Examples: FNC1ABCD ^{FNC1E} cannot be read A ^{FNC1BCD^{FNC1E} cannot be read FNC1FNC1ABCD^{FNC1E} cannot be read ABCD^{FNC1E} is read as ABCD^{29E} ABCDE is read as ABCDE}
Enable	Enable	Read both types of symbols.
		Examples: FNC1ABCD ^{FNC1E} are read as ABCD ^{29E} A ^{FNC1BCD^{FNC1E} are read as ABCD^{29E} FNC1FNC1ABCD^{FNC1E} are read as ABCD^{29E} ABCD^{FNC1E} is read as ABCD^{29E} ABCDE is read as ABCDE}

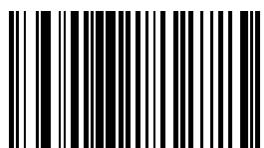

ISBT-128

Set this parameter by scanning either of the bar codes shown below.

* Enable ISBT-128

Disable ISBT-128

Lengths for Code 128

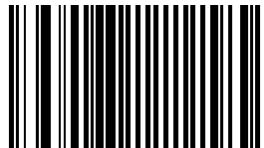

No length setting is required for Code 128. The default setting is Any Length.

Code 39

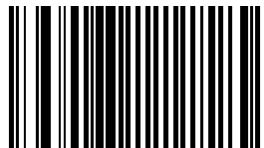

Note: This parameter must be enabled when “Convert Code 39 to Code 32” is to be enabled.

Set this parameter by scanning either of the bar codes shown below.

* Enable Code 39

Disable Code 39

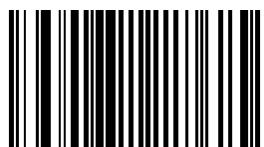

Code 39 Check Digit Verification

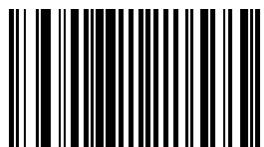

When enabled, this parameter checks the integrity of a Code 39 symbol to ensure it complies with specified algorithms. Only those Code 39 symbols which include a modulo 43 check digit are decoded when this parameter is enabled.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 39 Check Digit Verification

* Disable Code 39 Check Digit Verification

Code 32 Prefix

This parameter adds the prefix character “A” to all Code 32 bar codes.

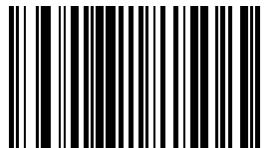

Note: When enabled, “[Convert Code 39 to Code 32](#)” parameter must also be enabled.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 32 Prefix

* Disable Code 32 Prefix

Convert Code 39 to Code 32

Note: [Code 39](#) must be enabled in order for this parameter to function.

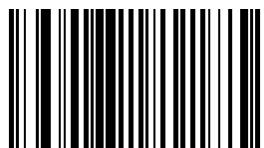

Note: When parameter “[Code 32 Prefix](#)” is to be enabled, this Convert Code 39 to Code 32 (Italian Pharma Code) parameter must also be enabled.

Set this parameter by scanning either of the bar codes shown below.

Enable Convert Code 39 to Code 32

* Disable Convert Code 39 to Code 32

Code 39 Full ASCII Conversion

Note: *Code 39 Full ASCII and Trioptic Code 39 should not be enabled simultaneously.*

When enabled, the ASCII character set assigns a code to letter, punctuation marks, numerals, and most control keystrokes on the keyboard.

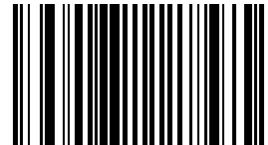

The first 32 codes are non-printable and are assigned to keyboard control characters such as [Backspace] and [Return or Enter]. The other 96 are called printable codes because all but [Space] and [Delete] produce visible characters.

Code 39 Full ASCII interprets the bar code special character (\$ + % /) preceding a Code 39 character and assigns an ASCII character value to the pair.

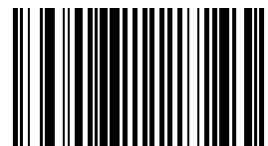

See the table titled “[ASCII Character Equivalents](#)”.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 39 Full ASCII Conversion

* Disable Code 39 Full ASCII Conversion

Set Lengths for Code 39

L1 Parameter Default Value: 2

L2 Parameter Default Value: 55

Lengths for Code 39 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

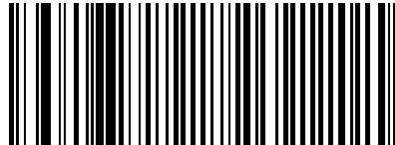

The length of a code refers to the number of characters, including check digits, the code contains. If “[Code 39 Full ASCII](#)” is enabled, “Length Within a Range” or “Any Length” are the preferred options.

See the table titled “[ASCII Character Equivalents](#)”.

Code 39 One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 39 symbols containing 14 characters, scan the “Code 39 One Discrete Length” bar code and then “1” and “4” bar codes using the “[Keypad Number Symbols](#)” at the end of this chapter.

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Code 39 Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 39 symbols containing 2 or 14 characters, scan the “Code 39 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the “[Keypad Number Symbols](#)” at the end of this chapter.

To begin setting **two discrete lengths**, scan this bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Code 39 Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 39 symbols containing between 4 and 12 characters, scan the “Code 39 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **lengths within a range**, scan this bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Code 39 Any Length

This option decodes Code 39 bar codes containing any number of characters.

To set **any length**, scan this bar code:

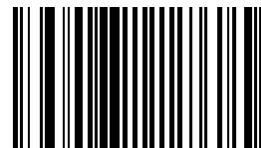

Transmit Code 39 Check Digit

When enabled, the check digit is transmitted with the data.

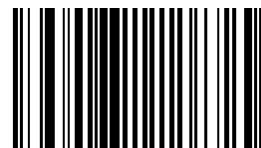

Parameter setting for “Code 39 Check Digit Verification” has no effect on this parameter value.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit Code 39 Check Digit

* Disable Transmit

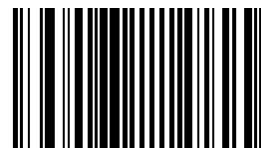

Trioptic Code 39

Trioptic Code 39 symbols always contain six characters.

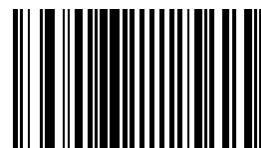

Note: When Trioptic Code 39 is enabled, set the “[Code 39 Full ASCII](#)” parameter to disabled. Both parameters should not be enabled simultaneously.

Set this parameter by scanning either of the bar codes shown below.

Enable Trioptic Code 39

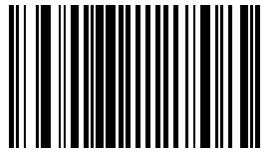

* Disable Trioptic Code 39

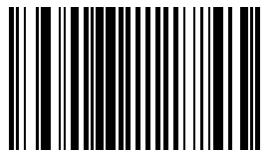

Code 93

When enabled, Code 93 symbols will be scanned, decoded and transmitted. Set this parameter by scanning either of the bar codes shown below.

Enable Code 93

* Disable Code 93

Set Lengths for Code 93

L1 Parameter Default Value: 4

L2 Parameter Default Value: 55

Lengths for Code 93 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 93 symbols containing 14 characters, scan the “Code 93 One Discrete Length” bar code and then “1” and “4” bar codes using the bar codes on the [“Keypad Number Symbols”](#) page.

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 93 symbols containing 2 or 14 characters, scan the “Code 93 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [“Keypad Number Symbols”](#) at the end of this chapter.

To begin setting **two discrete lengths**, scan this bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 93 symbols containing between 4 and 12 characters, scan the “Code 93 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#) at the end of this chapter.

To begin setting **lengths within a range**, scan this bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes Code 93 bar codes containing any number of characters.

To set **any length**, scan this bar code:

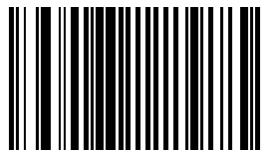

Discrete 2 of 5

When enabled, Discrete 2 of 5 (D 2 of 5) symbols will be scanned, decoded and transmitted. Set this parameter by scanning either of the bar codes shown below.

Enable Discrete 2 of 5

* Disable Discrete 2 of 5

Set Lengths for Discrete 2 of 5

L1 Parameter Default Value: 1 **Discrete Length:** 12

L2 Parameter Default Value: 12

Lengths for D 2 of 5 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

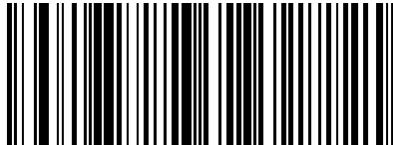

The length of a code refers to the number of characters, including check digits, the code contains.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only D 2 of 5 symbols containing 14 characters, scan the “D 2 of 5 One Discrete Length” bar code and then “1” and “4” bar codes using the bar codes on the [“Keypad Number Symbols”](#) page.

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only D 2 of 5 symbols containing 2 or 14 characters, scan the “D 2 of 5 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **two discrete lengths**, scan this bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only D 2 of 5 symbols containing between 4 and 12 characters, scan the “D 2 of 5 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **lengths within a range**, scan this bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes D 2 of 5 bar codes containing any number of characters.

*Note: **Important:** Selecting this option may lead to misdecodes for D 2 of 5 codes.*

To set **any length**, scan this bar code:

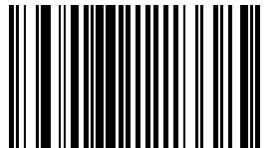

Interleaved 2 of 5

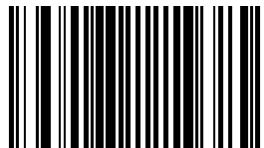

When enabled, Interleaved 2 of 5 (I 2 of 5) symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

* Enable Interleaved 2 of 5

Disable Interleaved 2 of 5

I 2 of 5 Digit Verification

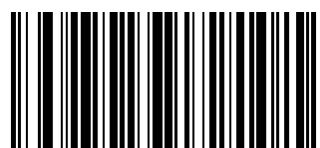

When enabled, this parameter checks the integrity of an I 2 of 5 symbol to ensure it complies with a specified algorithm, either USS (Uniform Symbology Specification) or OPCC (Optical Product Code Council).

Set this parameter by scanning one of the bar codes shown below.

* Disable I 2 of 5 Check Digit Verification

USS Check Digit

OPCC Check Digit

Convert I 2 of 5 to EAN-13

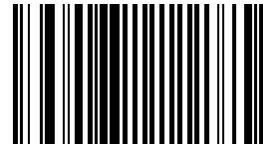

A successful bar code conversion requires the following to be true:

- Interleaved 2 of 5 scanning is enabled.
- One of the I 2 of 5 lengths is set to 14.
- The bar code has a leading zero.
- The bar code has a valid EAN-13 check digit.

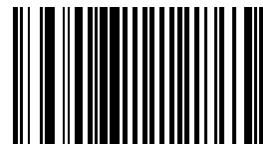

When enabled, the parameter converts a 14 character Interleaved 2 of 5 bar code into EAN-13 and transmits it to the host as EAN-13.

Set this parameter by scanning either of the bar codes shown below.

Enable Convert Interleaved 2 of 5 to EAN-13

* Disable Convert Interleaved 2 of 5 to EAN-13

Set Lengths for I 2 of 5

L1 Parameter Default Value: 14

L2 Parameter Default Value: 14

Lengths for I 2 of 5 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

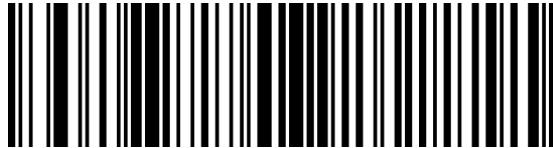

The length of a code refers to the number of characters, including check digits, the code contains. When settings lengths, single digit numbers must always be preceded by a leading zero.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to decode I 2 of 5 symbols containing only 14 characters, scan the “I 2 of 5 One Discrete Length” bar code and then the “1” and “4” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **one discrete length**, scan this “I 2 of 5 One Discrete Length” bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only I 2 of 5 symbols containing 6 or 14 characters, scan the “I 2 of 5 Two Discrete Lengths” bar code and then “0”, “6”, “1” and “4” bar codes to decode only I 2 of 5 symbols containing 6 or 14 characters. Use the [“Keypad Number Symbols”](#) at the end of this section.

To begin setting **two discrete lengths**, scan this “I 2 of 5 Two Discrete Lengths” bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only I 2 of 5 symbols containing between 4 and 12 characters, scan the “I 2 of 5 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#) at the end of this section.

To begin setting **lengths within a range**, scan this “I 2 of 5 Length Within Range” bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes I 2 of 5 bar codes containing any number of characters.

Note: Important: Selecting this option may lead to misdecodes for I 2 of 5 codes.

To set **any length**, scan this “I 2 of 5 Any Length” bar code:

[See Also: "Set Lengths for I 2 of 5 \(superseded\)"](#)

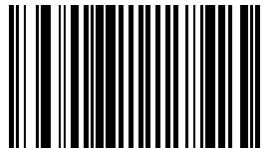

Transmit I 2 of 5 Check Digit

When enabled, the check digit is transmitted with the data.

Parameter setting for “[I 2 of 5 Check Digit Verification](#)” has no effect on this parameter value.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit I 2 of 5 Check Digit

* Disable Transmit I 2 of 5 Check Digit

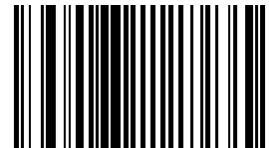

MSI Plessey

When enabled, MSI Plessey symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable MSI

* Disable MSI

MSI Plessey Check Digit Algorithm

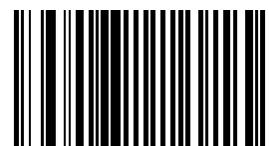

When the “[Two MSI Plessey Check Digits](#)” option is selected, an additional verification is required to ensure integrity. Either of the two following algorithms may be selected.

Set this parameter by scanning either of the algorithm bar codes shown below.

Mod 10/Mod 11

* Mod 10/Mod 10

MSI Plessey Check Digits

Check digits placed at the end of the MSI Plessey bar code verify the integrity of the data. At least one check digit is always required. Check digits are not automatically transmitted with the data.

Note: When Two Check Digits is selected, an “[MSI Plessey Check Digit Algorithm](#)” must also be selected.

Set the number of check digits to be included with the bar code by scanning either of the bar codes shown below.

* One MSI Plessey check digit

Two MSI Plessey check digits

Set Lengths for MSI Plessey

L1 Parameter Default Value: 06

L2 Parameter Default Value: 55

Lengths for MSI Plessey may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only MSI Plessey symbols containing 14 characters, scan the “MSI Plessey One Discrete Length” bar code and then “1” and “4” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **one discrete length**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only MSI Plessey symbols containing 2 or 14 characters, scan the “MSI Plessey Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **two discrete lengths**, scan this bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only MSI Plessey symbols containing between 4 and 12 characters, scan the “MSI Plessey Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#).

To begin setting **lengths within a range**, scan this bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes MSI Plessey bar codes containing any number of characters.

Note: Important: Selecting this option may lead to misdecodes for MSI Plessey codes.

To set **any length**, scan this bar code:

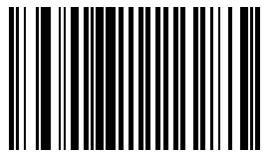

Transmit MSI Plessey Check Digit

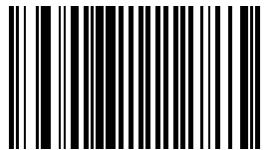

When enabled, the check digit is transmitted with the data.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit MSI Plessey Check Digit

* Disable Transmit MSI Plessey Check Digit

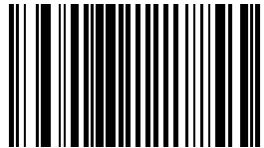

UPC/EAN

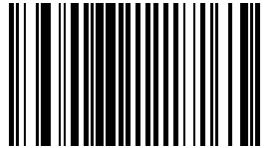

UPC-A

Select an option by scanning either of the bar codes shown below.

* Enable UPC-A

Disable UPC-A

UPC-E

Select an option by scanning either of the bar codes shown below.

* Enable

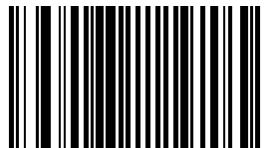

Disable

UPC-E1

Select an option by scanning either of the bar codes shown below.

Enable UPC-E1

* Disable UPC-E1

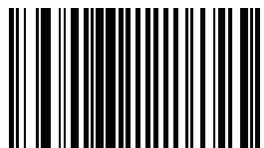

EAN-8

Select an option by scanning either of the bar codes shown below.

* Enable EAN-8

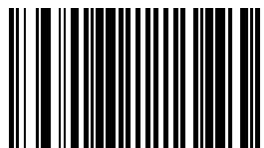

Disable EAN-8

EAN-13

Select an option by scanning either of the bar codes shown below.

* Enable EAN-13

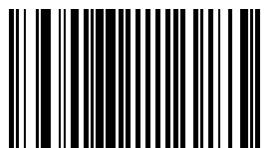

Disable EAN-13

Bookland EAN

Select an option by scanning either of the bar codes shown below.

Enable Bookland EAN

* Disable Bookland EAN

Bookland ISBN Format

Select one of the following formats for Bookland data when Bookland EAN is enabled.

- **Bookland ISBN-10** - The scanner reports Bookland data starting with 978 in traditional 10-digit format with the special Bookland check digit for backward-compatibility. Data starting with 979 is not considered Bookland in this mode.
- **Bookland ISBN-13** - The scanner reports Bookland data (starting with either 978 or 979) as EAN-13 in 13-digit format to meet the 2007 ISBN-13 protocol.

* Bookland ISBN-10

Bookland ISBN-13

For Bookland EAN to function properly, first enable Bookland EAN using [Enable/Disable Bookland EAN](#), then select either Decode UPC/EAN Supplements, Autodiscriminate UPC/EAN Supplements, or Enable 978/979 Supplemental Mode in [Decode UPC/EAN Supplements](#).

Check Digits

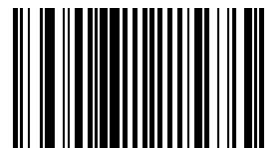

Transmit UPC-A Check Digit

This parameter determines whether the symbol will be transmitted with or without the UPC-A check digit. Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-A Check Digit

Disable Transmit UPC-A Check Digit

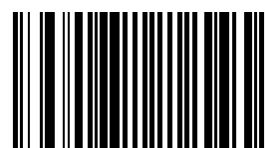

Transmit UPC-E Check Digit

This parameter determines whether the symbol will be transmitted with or without the UPC-E check digit. Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-E Check Digit

Disable Transmit UPC-E Check Digit

Transmit UPC-E1 Check Digit

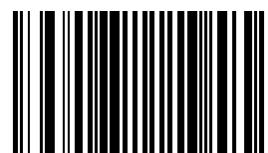

This parameter determines whether the symbol will be transmitted with or without the UPC-E1 check digit.

Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-E1 Check Digit

Disable Transmit UPC-E1 Check Digit

Conversions

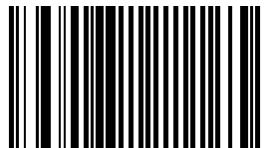

Convert UPC-E to UPC-A

When this parameter is enabled, UPC-E (zero suppressed) decoded data is converted to UPC-A format before transmission. After conversion, data follows UPC-A format and is affected by UPC-A programming selections (e.g. Preamble, Check Digit, etc.).

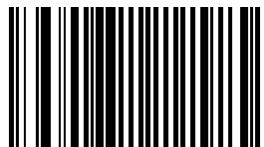

When disabled, UPC-E (zero suppressed) decoded data is transmitted without conversion.

Select an option by scanning either of the bar codes shown below.

Enable UPC-E to UPC-A conversion

* Disable UPC-E to UPC-A conversion

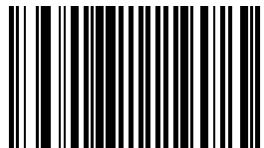

Convert UPC-E1 to UPC-A

When this parameter is enabled, UPC-E1 (zero suppressed) decoded data is converted to UPC-A format before transmission. After conversion, data follows UPC-A format and is affected by UPC-A programming selections (e.g. Preamble, Check Digit, etc.).

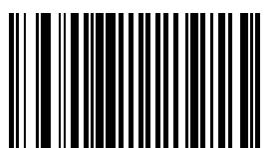

When disabled, UPC-E1 (zero suppressed) decoded data is transmitted without conversion.

Select an option by scanning either of the bar codes shown below.

Enable UPC-E1 to UPC-A conversion

* Disable UPC-E1 to UPC-A conversion

Convert EAN-8 to EAN-13 Type

When “EAN-8 Zero Extend” is enabled, this parameter setting labels the extended symbol as either an EAN-13 bar code or an EAN-8 bar code.

When “EAN-8 Zero Extend” is disabled, this parameter’s conversion setting is ignored.

Select an option by scanning either of the bar codes shown below.

* Type is EAN-13

Type is EAN-8

Preambles

UPC-A Preamble

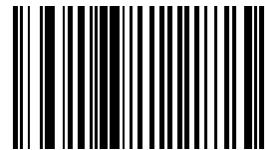

A preamble is a lead-in character for UPC-A symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

No UPC-A Preamble
<DATA>

* System Character
<SYSTEM CHARACTER><DATA>

System Character and Country Code
(“0” for USA)
<COUNTRY CODE> <SYSTEM CHARACTER> <DATA>

UPC-E Preamble

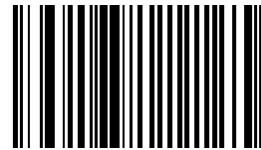

A preamble is a lead-in character for UPC-E symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

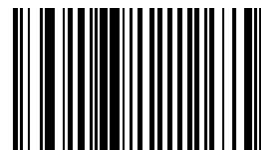

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

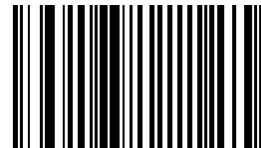

No UPC-E Preamble
<DATA>

* System Character
<SYSTEM CHARACTER><DATA>

System Character and Country Code
(“0” for USA)
<COUNTRY CODE> <SYSTEM CHARACTER> <DATA>

UPC-E1 Preamble

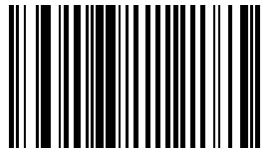

A preamble is a lead-in character for UPC-E1 symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

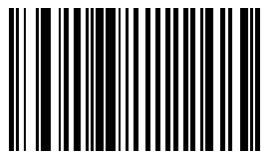

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

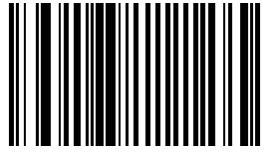

No UPC-E1 Preamble
<DATA>

* System Character
<SYSTEM CHARACTER><DATA>

System Character and Country Code
(“0” for USA)
<COUNTRY CODE> <SYSTEM CHARACTER> <DATA>

Supplements

Decode UPC/EAN Supplements

Note: In order to minimize the risk of invalid data transmission, for best results select whether to read or ignore supplemental characters.

Supplements are additionally appended characters (2 or 5) according to specific code format conventions (e.g. UPC-A + 2).

Select an option by scanning one of the bar codes shown below.

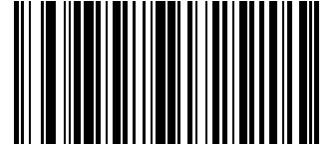

Decode UPC/EAN with Supplements

UPC/EAN symbols without supplemental characters are not decoded.

* Ignore UPC/EAN with Supplements

When a UPC/EAN plus supplemental symbol is scanned, the UPC/EAN is decoded and the supplemental characters ignored.

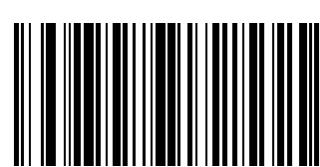

Autodiscriminate UPC/EAN Supplements

When this option is selected you must assign a value to the “Decode UPC/EAN Supplemental Redundancy” parameter. A value of 5 or more is recommended.

Enable 378/379 Supplemental Mode

The scanner will identify supplements for EAN-13 bar codes that start with a 378 or 379 prefix only. All other UPC/EAN codes are decoded immediately and the supplemental characters ignored.

Enable 978/979 Supplemental Mode

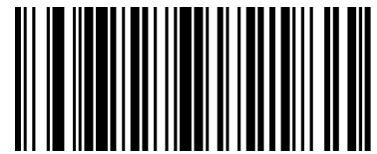

If you select 978/979 Supplemental Mode and are scanning Bookland EAN bar codes, see [Enable/Disable Bookland EAN](#) to enable Bookland EAN, and select a format using [Bookland ISBN Format](#).

Enable 977 Supplemental Mode

Enable 414/419/434/439 Supplemental Mode

Enable 491 Supplemental Mode

Enable Smart Supplemental Mode

Applies to EAN-13 bar codes starting with any prefix listed previously.

Supplemental User Programmable Type 1

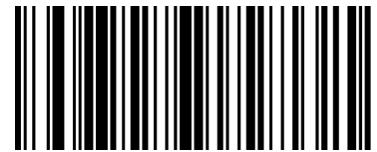

Supplemental User Programmable Type 1 and 2

Smart Supplemental Plus User Programmable 1

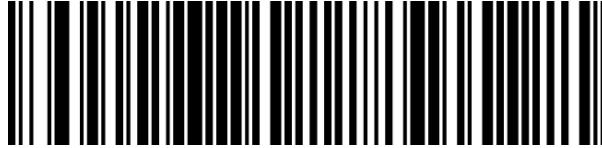

Smart Supplemental Plus User Programmable 1 and 2

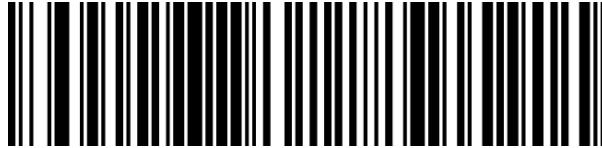

User-Programmable Supplements

When Supplemental User-Programmable option is selected from [Decode UPC/EAN Supplements](#), select **User-Programmable Supplement 1** to set the 3-digit prefix. Then select the 3 digits using the “[Keypad Number Symbols](#)”.

User-Programmable Supplemental 1

User-Programmable Supplemental 2

When Supplemental User-Programmable option is selected from [Decode UPC/EAN Supplements](#), select **User-Programmable Supplement 2** to set the 3-digit prefix. Then select the 3 digits using the “[Keypad Number Symbols](#)”..

Decode UPC/EAN Supplemental Redundancy

Parameter Default Value: 7 Times

With Autodiscriminate UPC/EAN Supplements selected, this option adjusts the number of times a symbol without supplements will be decoded before transmission. The range is from 2 to 20 times. Five or above is recommended when decoding a mix of UPC/EAN symbols with and without supplements, and the autodiscriminate option is selected.

To begin **setting the decode redundancy value**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value using the “[Keypad Number Symbols](#)”. Single digit numbers must have a leading zero.

If you wish to change your selection, scan Cancel on the “[Keypad Number Symbols](#)” page.

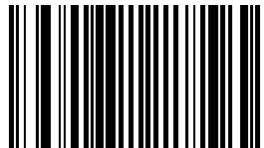

EAN-8 Zero Extend

When this parameter is enabled, five leading zeros are added to decoded EAN-8 symbols to make them compatible in format to EAN-13 symbols. Use parameter “[Convert EAN-8 to EAN-13 Type](#)” to label the extended symbol.

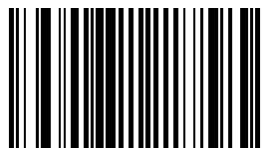

When disabled, EAN-8 symbols are transmitted as is and parameter “Convert EAN-8 to EAN-13 Type” setting is ignored.

Select an option by scanning either of the bar codes shown below.

Enable EAN-8 Zero Extend

* Disable EAN-8 Zero Extend

UCC Coupon Extended Code

Note: UCC Coupon Extended Code replaces UPC/EAN Coupon Code.

The UCC Coupon Extended Code is an additional bar code adjacent to a UCC Coupon Code. To enable or disable UCC Coupon Extended Code, scan the appropriate bar code below.

Enable UCC Coupon Extended Code

* Disable UCC Coupon Extended Code

UPC/EAN Security Level

Use this parameter to determine the security level appropriate for UPC/EAN bar code quality. There is an inverse relationship between security and scanner aggressiveness, so be sure to choose only that level of security necessary for any given application.

There are four decode security levels. Higher security levels are selected for decreasing levels of bar code quality. As security levels increase, the scanners aggressiveness decreases.

UPC / EAN Security Level	
Level 0	The default setting. Allows the scanner to operate in its most aggressive state, while providing sufficient security in decoding "in-spec" UPC/EAN bar codes.
Level 1	Misdecode 1,2,7,8 As bar code quality levels diminish, certain characters become prone to misdecodes before others (i.e. 1, 2, 7, 8). Select this level upon misdecodes of poorly printed labels that are limited to 1, 2, 7 and 8.
Level 2	Misdecodes not 1,2,7,8 Select this security level upon experiencing misdecodes of poorly printed bar codes and the misdecodes are not limited to characters 1,2,7 and 8.
Level 3	Select this security level if you have tried security level 2 and are still experiencing misdecodes. Using this level is an extreme measure against misdecoding severely out of spec bar codes. This level significantly impairs the decoding ability of the scanner. If this level of security is necessary, you should try to improve the quality of your bar codes.

Select an option by scanning one of the bar codes shown below. If you wish to change your selection, scan Cancel.

UPC/EAN Security Level

*** Level 0**

GS1 DataBar (RSS) Codes

Parameter Default Value: All Parameters : Disable

GS1 DataBar Omnidirectional (RSS-14)

Enable GS1 DataBar Omnidirectional (RSS-14)

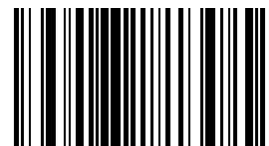

* Disable GS1 DataBar Omnidirectional (RSS-14)

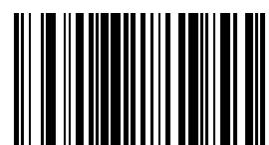

GS1 DataBar Limited (RSS-Limited)

Enable GS1 DataBar Limited (RSS-Limited)

* Disable GS1 DataBar Limited (RSS-Limited)

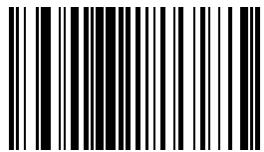

GS1 DataBar Expanded (RSS-Expanded)

Enable GS1 DataBar Expanded (RSS-Expanded)

* Disable GS1 DataBar Expanded (RSS-Expanded)

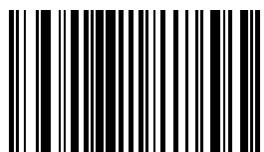

Convert GS1 DataBar (RSS) to UPC/EAN

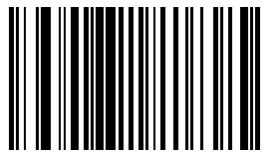

This parameter only applies to GS1 DataBar Omnidirectional (RSS-14) and GS1 DataBar Limited (RSS Limited) symbols. When this conversion is enabled, GS1 DataBar Omnidirectional (RSS-14) and GS1 DataBar Limited (RSS Limited) symbols encoding a single zero as the first digit have the leading '010' stripped and the bar code reported as EAN-13.

Bar codes beginning with two or more zeros but not six zeros have the leading '0100' stripped and the bar code reported as UPC-A. The UPC-A Preamble parameter to transmit the system character and country code applies to converted bar codes. Note that neither the system character nor the check digit can be stripped.

Enable Convert GS1 DataBar (RSS) to UPC/EAN

* Disable Convert GS1 DataBar (RSS) to UPC/EAN

Appendix

This appendix contains information that is superseded by newer information.

It contains programming bar codes for Symbol SE955 scan engines only.

[Laser On Time](#)

[Scan Angle](#)

[Set Lengths for Interleaved 2 of 5](#)

Laser On Time (superseded)

For correct operation, reboot the Bluetooth Ring Scanner after changing this value.

Note: The bar code on this page has been replaced with a newer bar code. [See Also: "Laser On Time".](#)

Parameter Default Value: 3.0 seconds

This parameter sets the maximum time decode processing continues during a scan attempt. It is programmable in 0.1 second increments from 0.5 to 9.9 seconds. If a label has not been decoded before this time expires and the session is terminated, the system regards it as a failed scan attempt.

To begin setting **Laser On Time**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired on time using the [Keypad Number Symbols](#) at the end of this section. Times less than 1.0 second must have a leading zero.

If you wish to change your number selection, scan Cancel on the "Keypad Number Symbols" page.

Scan Angle (SE955 only) superseded

Note: The bar code on this page has been replaced with a newer bar code. See Also: "Scan Angle (SE955 only)".

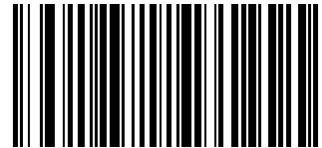

Choose one of the options below to set the scan angle to narrow or wide. Once the parameter bar code is scanned, the Scan Angle setting is persistently stored.

Select an option by scanning one of the bar codes shown below.

Narrow Angle (35°)

* Wide Angle

Set Lengths for I 2 of 5 (superseded)

Note: The bar codes on this page have been replaced with newer bar codes. See Also: "Set Lengths for I 2 of 5".

L1 Parameter Default Value: 14

L2 Parameter Default Value: 14

Lengths for I 2 of 5 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

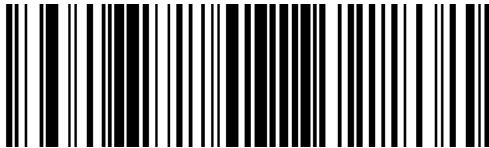

The length of a code refers to the number of characters, including check digits, the code contains.

See the table titled "[ASCII Character Equivalents](#)".

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only I 2 of 5 symbols containing 14 characters, scan the "I 2 of 5 One Discrete Length" bar code and then the "1" and "4" bar codes using the "[Keypad Number Symbols](#)".

To begin setting **one discrete length**, scan this "I 2 of 5 One Discrete Length" bar code:

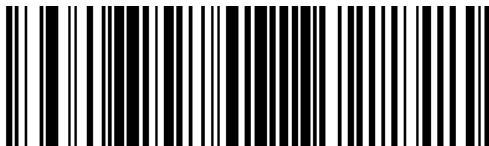

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the "Keypad Number Symbols" page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only I 2 of 5 symbols containing 2 or 14 characters, scan the "I 2 of 5 Two Discrete Lengths" bar code and then "0", "2", "1" and "4" bar codes using the "[Keypad Number Symbols](#)" at the end of this section.

To begin setting **two discrete lengths**, scan this "I 2 of 5 Two Discrete Lengths" bar code:

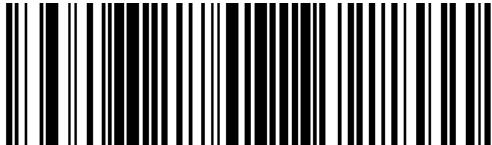

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the "Keypad Number Symbols" page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only I 2 of 5 symbols containing between 4 and 12 characters, scan the “I 2 of 5 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Keypad Number Symbols”](#) at the end of this section.

To begin setting **lengths within a range**, scan this “I 2 of 5 Length Within Range” bar code:

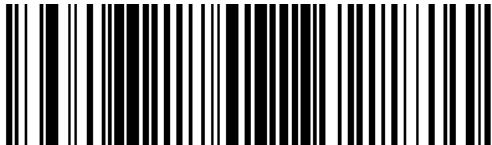

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. If you wish to change your number selection, scan Cancel on the “Keypad Number Symbols” page.

Any Length

This option decodes I 2 of 5 bar codes containing any number of characters.

Note: Important: Selecting this option may lead to misdecodes for I 2 of 5 codes.

To set **any length**, scan this “I 2 of 5 Any Length” bar code:

Keypad Number Symbols

The bar code labels shown below represent a numeric keypad, with decimal values 0 through 9. Each label can be scanned individually to enter a numeric value. Use these numeric value symbols to enter numeric input in the course of performing a scan engine system configuration.

Chapter 4: Symbol Laser Imager Programming Bar Codes

Note: These bar codes, explanations and instructions are for programming the Symbol laser imager engine in your ring imager. Please do not scan the bar codes in this section with any other imager or laser engine.

Introduction

Note: The SE4400 tethered ring imager does not have beep / audio capability.

Assumption: The user is familiar with Windows on-screen functions.

Scan engine manufacturers may offer more bar codes and options than are contained in this chapter. Please note that the bar codes in this chapter are only those supported by Honeywell and the mobile devices it manufactures or supports. Contact [Technical Assistance](#) if you need assistance when using the bar codes in this chapter.

To change a parameter value scan the appropriate bar code in this chapter. The new value replaces the standard default value in memory.

An asterisk (*) next to an option indicates the default setting.

Note: Using the imager like a camera (or for OCR decoding) is not supported in this release.

The following SE4400 bar code symbologies are supported:

Symbology	Symbology
Codabar	Aztec / Aztec Inverse
Code 11	PDF417
Code 128	MicroPDF
Code 39	Code 128 Emulation
Code 93	Data Matrix / Data Matrix Inverse
Composites	Maxicode
Discrete 2 of 5	MicroQR
Interleaved 2 of 5	QR Code / QR Inverse
MSI Plessey	GS1 DataBar (RSS)
UPC / EAN	Postal Codes

Note: The default value for all Postal Code symbologies is "Enabled." For best performance when reading a specific postal symbology, all other postal symbologies should be disabled.

Prefix / Suffix

Ring decoder engine prefix and suffix parameters should not be set, changed, or reset using the Prefix and Suffix bar codes shown in this section. When the Bluetooth Ring Scanner Module is reset to defaults, the prefix and suffix settings revert to their default values and need to be scanned again. Use the Scanner or Data Collection control panel in the host computer to store prefix and suffix values.

Refer to "Scanner" or "Data Collection" in the host Reference Guide (e.g. MX8, VM1) for information and instruction on setting up the following ring imager parameters:

- Enable/Disable decoding sounds
- Imager LED Illumination
- COM1 Serial Parameters
- Code ID: AIM, Symbol, Custom
- Symbology Settings including Prefix/Suffix
- Control Character Mapping
- Custom Identifiers

Pre-Configured Default Values

Set All Defaults/Cancel Bar Codes

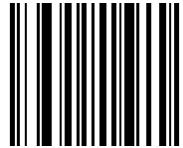

Use the Set All Defaults bar code to return all parameters to their default values. Scanning this bar code does not affect the mobile device's operating system, wireless client or installed software (e.g. AppLock) settings.

Note: When the Parameter Scanning parameter is disabled, the scan engine can still scan the Set All Defaults bar code. Default value of Parameter Scanning is Enable.

When parameters are changed, the new value replaces the standard default value in memory.

See Also: "Reset"

Set All Defaults

Cancel

See [Pre-Configured Default Values](#) for an alphabetical listing of all default values.

Enable / Disable Parameter Scanning

Use this parameter to decide whether scanner parameters can be set using the bar codes in this chapter.

Note: When this parameter is disabled, scan the [Set All Defaults](#) parameter bar code to enable parameter scanning.

When disabled, either scan the Enable Parameter Scans bar code or the Set All Defaults bar code to reset the parameter.

When enabled, scanners can be configured using the bar codes in this chapter.

Select a mode by scanning either of the bar codes shown below.

* Enable Parameter Scans

Disable Parameter Scans

Imager Parameters – General

Except for the General imager attributes in this section that can be set by the end-user, imager programming attributes are set using the bar code wedge panel (Control Panel Scanner or Data Collection wedge panel) resident on the host mobile device. Bar code manipulation parameters assigned using the Bar Code Wedge panels are applied to the data resulting from successful bar code scans.

Decode Session Timeout

Parameter Default Value: 9.9 Seconds

This parameter sets the maximum time decode processing continues during a scan attempt. It is programmable in 0.1 second increments from 0.5 to 9.9 seconds. If a label has not been decoded before this time expires and the session is terminated, the software regards it as a failed scan attempt.

To begin setting a decode session time-out in seconds, scan this Decode Session Timeout bar code:

Next, scan two numeric bar codes that correspond to the desired time-out using the [Imager Keypad Number Symbols](#) page.

Times less than 1.0 second must have a leading zero.

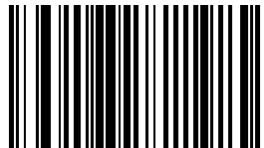

If you wish to change your number selection, scan Cancel on the Imager Keypad Number Symbols page.

Decode Aiming Pattern

Note: This parameter only applies when in Decode Mode. See [Operational Mode](#).

Scan Enable Decode Aiming Pattern to project the aiming pattern during bar code capture, or Disable Decode Aiming Pattern to turn the aiming pattern off.

* Enable Decode Aiming Pattern

Disable Decode Aiming Pattern

Decoding Autoexposure

Select Enable Autoexposure to allow the imager to control gain settings and exposure (integration) time to best capture an image for the selected operation mode.

Select Disable Autoexposure to manually adjust the gain and exposure time (not supported in this version). This option is only recommended for advanced users with difficult image capture situations.

* Enable Decoding Autoexposure

Disable Decoding Autoexposure

Decoding Illumination

Note: When this parameter is disabled, any LED Illumination parameter setting is ignored.

The decoder has three small bright LEDs situated above the scan aperture.

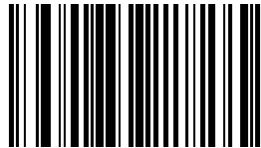

Enable this parameter for LED illumination upon every decode. The effectiveness of the illumination decreases as the distance to the target increases.

Disable this parameter to prevent LED illumination.

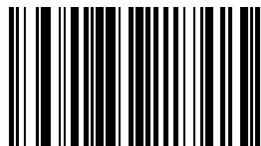

See [LED Illumination](#).

Select a setting by scanning one of the bar codes shown below.

* Enable Illumination

Disable Illumination

Focus Mode

Select a focus mode to control the working range of the imager.

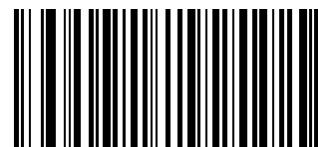

- When Far Focus is selected, the imager is optimized to read at its far position.
- With Near Focus, the imager is optimized to read at its near position.
- Smart Focus toggles the focus position after every frame. There may be audible signals from the ring imager as Smart Focus toggles after every frame.

Scan the appropriate bar code below.

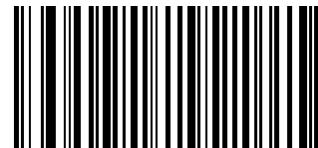

* Far Focus

Near Focus

Smart Focus

LED Illumination

Note: This parameter only applies for decoding if Decoding Illumination is enabled. If Decoding Illumination is disabled, all illumination is off for that mode, regardless of this LED Illumination setting.

Parameter Default Value: PL4407: Internal Illumination MS4407: External Illumination

The imager has three small bright LEDs situated above the scan aperture. Internal LED illumination turns the LEDs on during scan mode. The effectiveness of the illumination decreases as the distance to the target increases.

External illumination setting turns the LEDs off during scan mode.

Internal and External Illumination turns the LEDs on during scan mode.

See [Decoding Illumination](#).

Select an illumination setting by scanning one of the bar codes shown below.

Internal Illumination

External Illumination

Internal and External Illumination

Operational Mode

Parameter Default Value: Decode Mode

In **Decode Mode** (the default mode), and upon a Scan button event, the imager attempts to locate and decode enabled bar codes within its field of view.

The decoder remains in this mode as long as the Scan button is pressed or until a bar code is decoded.

Use **Snapshot mode** to capture a high quality image and transmit it to the host. While in this mode the decoder blinks the green LED at 1-second intervals to indicate it is not in standard operating (decode) mode.

In Snapshot Mode, the decoder turns on the laser aiming pattern to highlight the area to be captured in the image. The next trigger event instructs the decoder to capture a high quality image and transmit it to the host. A short time may pass (less than 2 seconds) between when the trigger is activated and the image is captured as the decoder adjusts to the lighting conditions.

Hold the imager steady until the image is captured, denoted by a single beep. If a trigger event is not activated within the Snapshot Mode Timeout period, the decoder returns to Decode Mode.

Use Snapshot Mode Timeout (not supported in this version) to adjust this timeout period. The default timeout period is 30 seconds.

To disable the laser aiming pattern during Snapshot Mode, see Snapshot Aiming Pattern (not supported in this version).

Use Video View Finder (not supported in this version) to enable Snapshot with Viewfinder Mode. In this mode the decoder behaves as a video camera until the trigger is active, at which time a Snapshot is performed as described above.

In Video mode the decoder behaves as a video camera as long as the trigger is active. When the trigger is released the imager returns to Decode Mode.

Note: A Decode Mode bar code is not available. The default is as follows – in other modes, when the trigger is released the imager returns to Decode Mode.

Snapshot Mode

Video Mode

Cancel

Power Mode

Note: Mobile devices are designed to be operated in Low Power Mode. For best results this value should remain unchanged.

Parameter Default Value: PL4407: Low Power MS4407: Continuous On

A parameter setting of Continuous On means the laser will not power down until the mobile device is powered off.

A parameter setting of Low Power means the laser will enter low power consumption mode after each decode attempt. Pressing the Scan button will begin another decode sequence.

See [Time Delay to Low Power Mode](#).

Select a Power Mode by scanning either of the bar codes shown below.

Continuous On

Low Power

Presentation Mode Session Timeout

This parameter, and the Presentation Mode parameter, are directed toward ring decoders that can scan a bar code that enters its field of view, determine a good read/bad read, then scan again.

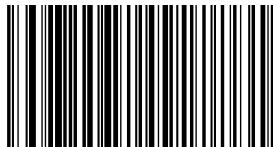

This parameter determines how long the ring decoder will attempt to decode a bar code before determining if it is a good read or a bad read.

Presentation Mode means the ring decoder is always On and will scan bar codes that enter its field of view. Presentation Mode applies to Decode Mode only.

See also [Trigger Modes](#).

Parameter Default Value: 2 Seconds

To set the duration of the attempt to decode a bar code detected in presentation mode, scan the **Presentation Mode Session Timeout** bar code below.

Next scan three numeric bar codes from [Imager Keypad Number Symbols](#) to select a value between 1 and 255 that represents tenths of a second. Single digit numbers must have a leading zero.

For example, to set 0.5 seconds, scan the Presentation Mode Session Timeout bar code, then scan the 0, 0, 5 bar codes from the section titled Imager Keypad Number Symbols. To correct an error or change the selection, scan the Cancel bar code and try again.

Time Delay to Low Power Mode

This parameter sets the time the decoder remains active after decoding. The decoder wakes upon a Scan button press or when the host attempts to communicate with the decoder.

This parameter only applies when [Power Mode](#) is set to Low Power.

* 1 Second Delay

5 Second Delay

1 Minute Delay

5 Minute Delay

15 Minute Delay

60 Minute Delay

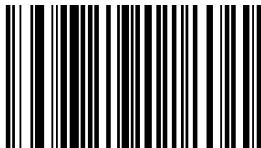

Time-out between Decodes, Same Symbol

Parameter Default Value: 0.6 Seconds

This option is used in presentation mode to prevent multiple reads of a symbol left in the ring decoder's field of view. The timeout begins when the bar code is removed from the field of view. It is programmable in 0.1 second increments from 0.0 to 9.9 seconds.

To select the timeout between decodes for the same symbol, scan the following bar code, then scan two numeric bar codes from the [Imager Keypad Number Symbols](#) at the end of this chapter that correspond to the desired interval, in 0.1 second increments.

Times less than 1.0 second must have a leading zero.

If you wish to change your number selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Trigger Modes

Note: Mobile devices with ring decoders are designed to be operated in Level Trigger Mode. for best results the Trigger Mode default value should remain unchanged.

Parameter Default Value: PL4407: Level Trigger Mode MS4407: Presentation Mode

Use this parameter to determine when the laser is activated and decoding begins, how long the laser remains on and what determines the cessation of the laser scan and decode process.

Select a trigger mode by scanning one of the bar codes that follow. If you wish to change your selection, scan Cancel.

Level Trigger Mode - A Scan button press activates the laser and decode processing. The laser remains on and decode processing continues until a Scan button release, a valid decode or the decode session time-out is reached.

Presentation Trigger Mode - When the ring scanner detects an object in its field of view it scans and attempts to decode. The range of object detection does not vary under normal lighting conditions. This applies to decode mode only. In Presentation Mode the unit does not enter its sleep state.

Host Trigger Mode - Triggering signal comes from a host command. Any actual Scan button press is interpreted by the scanner engine as a Level triggering option.

Level Trigger Mode

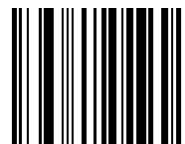

Presentation Trigger Mode

Host Trigger Mode

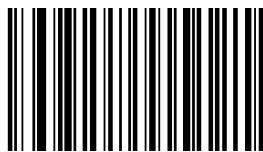

Cancel

See also [Presentation Mode Session Timeout](#).

Report Version

Scan the following bar code to view the **version of software currently installed** in the ring decoder. The result will be displayed on the host device display.

Transmit Code ID Character

Parameter Default Value: None

A code ID character identifies the code type of a scanned bar code. This may be useful when the imager is decoding more than one code type. In addition to any single character prefix already selected, the code ID character is inserted between the prefix and the decoded symbol.

Scan one of the following bar codes to select either no code ID character, a [Symbol Code ID character](#) or an [AIM Code ID character](#).

Transmit No Code ID Character

Transmit Symbol Code ID Character

A	UPC-A, UPC-E, UPC-E1, EAN-8, EAN-13
B	Code 39, Code 32
C	Codabar
D	Code 128
E	Code 93
F	Interleaved 2 of 5
G	Discrete 2 of 5 or Discrete 2 of 5 IATA
H	Code 11
J	MSI Plessey
K	UCC/EAN-128
L	Bookland EAN
M	Trioptic Code 39
N	Coupon Code
R	RSS-14, RSS-Limited, RSS-Expanded
T	UCC Composite, TLC 39
X	PDF417, MacroPDF417, MicroPDF417
P00	Data Matrix

Q	QR Code
S	Discrete 2 of 5, IATA 2 of 5
U	Maxicode
X	Code 39 Trioptic, Bookland EAN, US Postnet, US Planet, UK Postal, Japan Postal, Australian Postal, Dutch Postal

m= Modifier Character

The modifier character is the sum of the applicable option values based on the following table.

Code Type	Option Value	Option
Code39		
	0	No Check character or Full ASCII processing.
	1	Reader has checked one check character.
	3	Reader has checked and stripped check character.
	4	Reader has performed Full ASCII character conversion.
	5	Reader has performed Full ASCII character conversion and checked one check character.
	7	Reader has performed Full ASCII character conversion and checked and stripped check character.
		Example: A Full ASCII bar code with check character W,A+I+M1+DW, is transmitted as]A7Aimld where 7 = (3+4).
Trioptic Code 39		

Code Type	Option Value	Option
	0	No option specified at this time. Always transmit 0.
		Example: A Trioptic bar code 412356 is transmitted as]X0412356
Code 128		
	0	Standard data packet, No Function code 1 in first symbol position.
	1	Function code 1 in first symbol character position.
	2	Function code 1 in second symbol character position.
		Example: A Code (EAN) 128 bar code with Function 1 character in the first position, FNC1 Aim Id is transmitted as]CIAimId
I 2 of 5		
	0	No check digit processing.
	1	Reader has validated check digit.
	3	Reader has validated and stripped check digit .
		Example: An I 2 of 5 bar code without check digit, 4123, is transmitted as]I04123
Codabar		
	0	No check digit processing.
	1	Reader has checked check digit.
	3	Reader has stripped check digit before transmission.
		Example: A Codabar bar code without check digit, 4123, is transmitted as]F04123
Code 93		
	0	No options specified at this time. Always transmit 0.
		Example: A Code 93 bar code 012345678905 is transmitted as]G0012345678905
MSI Plessey		
	0	Single check digit checked.
	1	Two check digits checked.
	2	Single check digit verified and stripped before transmission.
	3	Two check digits verified and stripped before transmission.
		Example: An MSI Plessey bar code 4123, with a single check digit checked, is transmitted as]M04123
D 2 of 5		
	0	No options specified at this time. Always transmit 0.
		Example: A D 2 of 5 bar code 4123, is transmitted as]S04123
UPC/EAN		
	0	Standard packet in full EAN country code format, which is 13 digits for UPC-A and UPC-E (not including supplemental data).
	1	Two digit supplement data only
	2	Five digit supplement data only
	4	EAN-8 data packet.
		Example: A UPC-A bar code 012345678905 is transmitted as]E00012345678905
Bookland EAN		
	0	No options specified at this time. Always transmit 0.
		Example: A Bookland EAN bar code 123456789X is transmitted as]X0123456789X
Code 11		
	0	Single check digit.
	1	Two check digits.

Code Type	Option Value	Option
	3	Check characters validated but not transmitted.
RSS Family		
		No option specified at this time. Always transmit 0. RSS-14 and RSS-Limited transmit with an Application Identifier "01". Note: In UCC/EAN-128 emulation mode, RSS is transmitted using Code 128 rules (i.e.,]C1).
		Example: An RSS-14 bar code 100123456788902 is transmitted as]e001100123456788902.
EAN.UCC Composites (RSS, UCC/EAN-128, 2D portion of UPC composite)		
		Native mode transmission. Note: UPC portion of composite is transmitted using UPC rules.
0		Standard data packet.
1		Data packet containing the data following an encoded symbol separator character.
2		Data packet containing the data following an escape mechanism character. The data packet does not support the ECI protocol.
3		Data packet containing the data following an escape mechanism character. The data packet supports the ECI protocol.
-		UCC/EAN-128 emulation Note: UPC portion of composite is transmitted using UPC rules.
1		Data packet is a UCC/EAN-128 symbol (i.e., data is preceded with]JC1).
PDF417, Micro PDF417		
0		Reader set to conform to protocol defined in 1994 PDF417 symbology specifications. Note: When this option is transmitted, the receiver cannot reliably determine whether ECIs have been invoked or whether data byte 92DEC has been doubled in transmission.
1		Reader set to follow the ECI protocol (Extended Channel Interpretation). All data characters 92DEC are doubled.
2		Reader set for Basic Channel operation (no escape character transmission protocol). Data characters 92DEC are not doubled. Note: When decoders are set to this mode, unbuffered Macro symbols and symbols requiring the decoder to convey ECI escape sequences cannot be transmitted.
3		The bar code contains a UCC/EAN-128 symbol, and the first codeword is 903-907, 912, 914, 915.
4		The bar code contains a UCC/EAN-128 symbol, and the first codeword is in the range 908-909.
5		The bar code contains a UCC/EAN-128 symbol, and the first codeword is in the range 910-911.
		Example: A PDF417 bar code ABCD, with no transmission protocol enabled, is transmitted as]L2ABCD.
Data Matrix		
0		ECC 000-140, not supported.
1		ECC 200.
2		ECC 200, FNC1 in first or fifth position.
3		ECC 200, FNC1 in second or sixth position.
4		ECC 200, ECI protocol implemented.
5		ECC 200, FNC1 in first or fifth position, ECI protocol implemented.
6		ECC 200, FNC1 in second or sixth position, ECI protocol implemented.
MaxiCode		
0		Symbol in Mode 4 or 5.
1		Symbol in Mode 2 or 3.
2		Symbol in Mode 4 or 5, ECI protocol implemented.
3		Symbol in Mode 2 or 3, ECI protocol implemented in secondary message.
QR Code		

Code Type	Option Value	Option
	0	Model 1 symbol.
	1	Model 2 symbol, ECI protocol not implemented.
	2	Model 2 symbol, ECI protocol implemented.
	3	Model 2 symbol, ECI protocol not implemented, FNC1 implied in first position.
	4	Model 2 symbol, ECI protocol implemented, FNC1 implied in first position.
	5	Model 2 symbol, ECI protocol not implemented, FNC1 implied in second position.
	6	Model 2 symbol, ECI protocol implemented, FNC1 implied in second position.

According to AIM standards, a UPC with supplemental bar code is transmitted in the following format:

]EO (UPC chars) (terminator)]E2 (supplemental) (terminator)

Therefore, a UPC with two supplemental characters, 01234567890510, is transmitted to the host as a 21-character string,]E00012345678905]E110.

Prefix / Suffix Values

Ring decoder engine prefix and suffix parameters should not be set, changed, or reset using the Prefix and Suffix bar codes shown in this section. When the Bluetooth Ring Scanner Module is reset to defaults, the prefix and suffix settings revert to their default values and need to be scanned again. Use the Scanner or Data Collection control panel in the host computer to store prefix and suffix values.

See previous section titled [Prefix / Suffix](#) for an explanation.

Prefix (P) Parameter Default Value: Null

Suffix1 (S1) Parameter Default Value: LF

Suffix2 (S2) Parameter Default Value: CR

Note: Parameter "Scan Data Transmission Format" must be set before selecting Prefix/Suffix values.

A prefix and/or one or two suffixes may be appended to scan data for use in data editing. These values are set by scanning four bar codes (resulting in a four digit number) that correspond to key codes for various mobile devices. See the table titled [ASCII Character Equivalents](#) for keycodes.

Prefix

To begin setting Prefix values for SSI hosts first set the [Scan Data Transmission Format](#), then scan this **Scan Prefix** bar code:

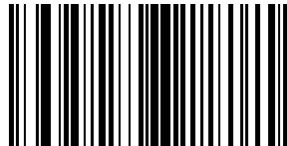

Next, scan four numeric bar codes that correspond to the computer key code using the [Imager Keypad Number Symbols](#) at the end of this chapter.

If you wish to change your selection, scan Cancel on the Imager Keypad Number Symbols page.

Suffix 1

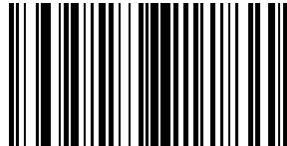

To begin setting Suffix 1 value, scan this **Scan Suffix 1** bar code:

Next, scan four numeric bar codes that correspond to the computer keycode using the "[Imager Keypad Number Symbols](#)". If you wish to change your selection, scan Cancel on the "Imager Keypad Number Symbols" page.

Suffix 2

To begin setting Suffix 2 value, scan this **Scan Suffix 2** bar code:

Next, scan four numeric bar codes that correspond to the computer keycode using the "[Imager Keypad Number Symbols](#)". If you wish to change your numeric selection, scan Cancel on the "Imager Keypad Number Symbols" page.

Scan Data Transmission Format

Note: Parameter [Prefix/Suffix Values](#) for SSI hosts should be set after setting this parameter.

Ring decoder engine prefix and suffix parameters should not be set, changed, or reset using the Prefix and Suffix bar codes shown in this section. When the Bluetooth Ring Scanner Module is reset to defaults, the prefix and suffix settings revert to their default values and need to be scanned again. Use the Scanner or Data Collection control panel in the host computer to store prefix and suffix values.

Use this option when you want to append a prefix and suffix to the SSI host decode data. If you wish to change your selection, scan the Cancel bar code and scan again.

Set the Scan Data Transmission Format parameter by scanning one of the following bar codes:

* Data As Is

[Data] [Suffix 1]

[Data] [Suffix 2]

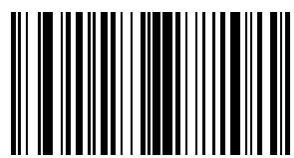

[Data] [Suffix 1] [Suffix 2]

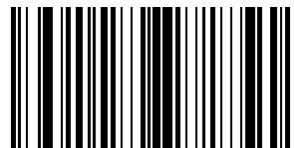

[Prefix] [Data]

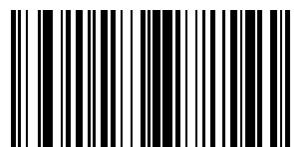

[Prefix] [Data] [Suffix 1]

[Prefix] [Data] [Suffix 2]

[Prefix] [Data] [Suffix 1] [Suffix 2]

Cancel

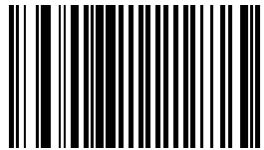

Transmit “No Read” Message

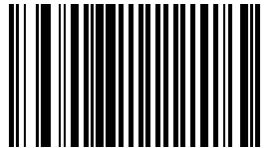

Scan a bar code below to select whether or not to transmit a No Read message.

When enabled, the characters NR are transmitted when a bar code is not decoded. When disabled, if a symbol does not decode, nothing is sent to the host.

Enable Transmit No Read

* Disable Transmit No Read

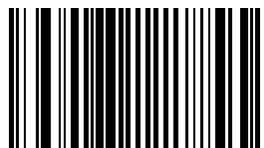

UPC/EAN

UPC-A

Select an option by scanning either of the bar codes shown below.

* Enable UPC-A

Disable UPC-A

UPC-E

Select an option by scanning either of the bar codes shown below.

* Enable UPC-E

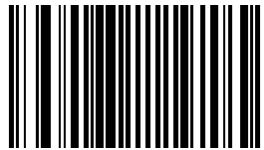

Disable UPC-E

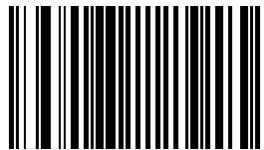

UPC-E1

Select an option by scanning either of the bar codes shown below.

Enable UPC-E1

* Disable UPC-E1

Note: UPC-E1 is not a UCC (Uniform Code Council) approved symbology.

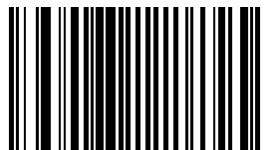

EAN-8/JAN-8

Select an option by scanning either of the bar codes shown below.

* Enable EAN-8/JAN-8

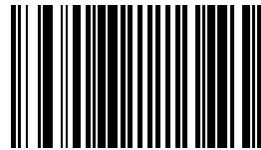

Disable EAN-8/JAN-8

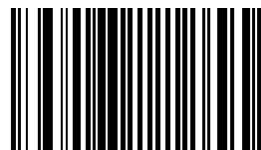

EAN-13/JAN-13

Select an option by scanning either of the bar codes shown below.

* Enable EAN-13/JAN-13

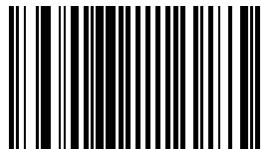

Disable EAN-13/JAN-13

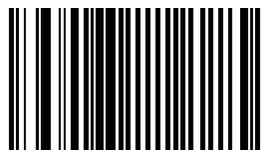

Bookland EAN

Select an option by scanning either of the bar codes shown below.

Enable Bookland EAN

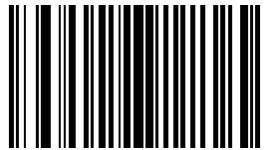

* Disable Bookland EAN

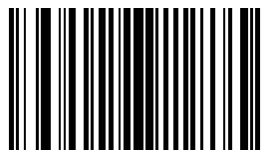

Bookland Format

This parameter is used to control the Bookland Format. Select an option by scanning either of the bar codes shown below.

* Bookland 10

Bookland 13

Decode UPC/EAN/JAN Supplements (2 and 5 digits)

Supplements are bar codes appended according to specific format conventions (e.g. UPC A+2, UPC E+2, EAN 13+2). Six options are available:

Selecting:

Option	Result
Decode UPC/EAN/JAN with Supplements	UPC/EAN/JAN symbols without supplemental characters are not decoded.
Ignore Supplements	The UPC/EAN/JAN symbol is decoded and the supplemental bar code is ignored.
Autodiscriminate UPC/EAN/JAN Supplements	When this option is selected you must assign a value to the "Decode UPC/EAN Supplemental Redundancy" parameter. A value of 5 or more is recommended.
Enable 378/379 Supplemental Mode	The scanner will identify supplements for EAN-13/JAN-13 bar codes that start with a 378 or 379 prefix only. All other UPC/EAN/JAN codes are decoded immediately and the supplemental characters ignored.
Enable 978 Supplemental Mode	The scanner will identify supplements for EAN-13/JAN-13 bar codes that start with a 978 prefix only. All other UPC/EAN/JAN codes are decoded immediately and the supplemental characters ignored.
Enable Smart Supplemental Mode	The scanner will identify supplements for EAN-13/JAN-13 bar codes that start with a 378, 379 or 978 prefix only. All other UPC/EAN/JAN bar codes are decoded immediately and the supplemental characters ignored.

Note: In order to minimize the risk of invalid data transmission, select whether to read or ignore supplemental characters.

Select an option by scanning one of the bar codes shown below. If you wish to change your selection, scan the Cancel bar code and scan again.

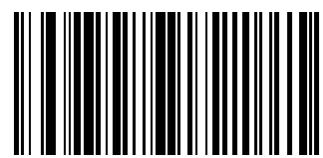

Decode UPC/EAN/JAN only with Supplements

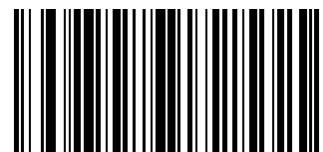

* Ignore Supplements

Autodiscriminate UPC/EAN/JAN Supplementals

Enable 378/379 Supplemental Mode

Enable 978 Supplemental Mode

Enable Smart Supplemental Mode

Cancel

UPC/EAN/JAN Supplemental Redundancy

Parameter Default Value: 10 Times

With Autodiscriminate UPC/EAN Supplements selected, this option adjusts the number of times a symbol without supplementals is decoded before transmission. The range is from 2 to 30 times. Five or above is recommended when decoding a mix of UPC/EAN/JAN symbols with and without supplementals, and the autodiscriminate option is selected.

To begin setting the **decode redundancy value**, scan this bar code:

Next, scan two numeric bar codes that correspond to the desired value using the [Imager Keypad Number Symbols](#). Single digit numbers must have a leading zero.

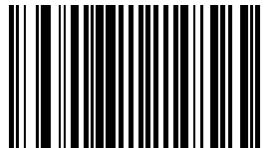

To correct an error or change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Transmit UPC-A Check Digit

This parameter determines whether the symbol will be transmitted with or without the UPC-A check digit.

Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-A Check Digit

Disable Transmit UPC-A Check Digit

Transmit UPC-E Check Digit

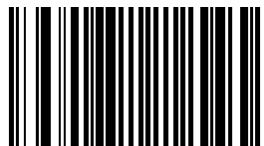

This parameter determines whether the symbol will be transmitted with or without the UPC-E check digit.

Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-E Check Digit

Disable Transmit UPC-E Check Digit

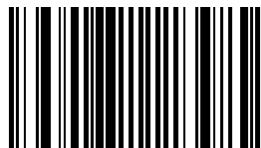

Transmit UPC-E1 Check Digit

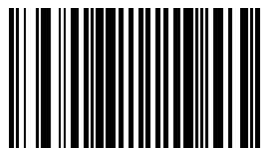

This parameter determines whether the symbol will be transmitted with or without the UPC-E1 check digit.

Select an option by scanning either of the bar codes shown below.

* Enable Transmit UPC-E1 Check Digit

Disable Transmit UPC-E1 Check Digit

UPC-A Preamble

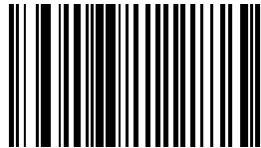

A preamble is a lead-in character for UPC-A symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

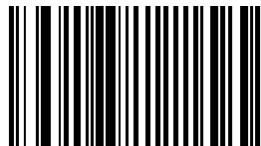

No Preamble

* System Character

System Character and Country Code ("0" for USA)

UPC-E Preamble

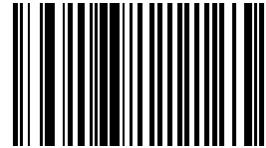

A preamble is a lead-in character for UPC-E symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

No Preamble

* System Character

System Character and Country Code
("0" for USA)

UPC-E1 Preamble

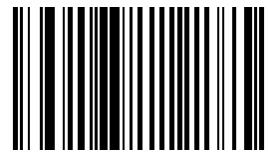

A preamble is a lead-in character for UPC-E1 symbols transmitted to the host device. The lead-in characters are considered part of the symbol.

Data is sent to the host in the following format:

No Preamble	[data]
System Character	[schar] [data]
System Character and Country Code	[country code] [schar] [data]

Select an option by scanning one of the bar codes shown below.

No Preamble

* System Character

System Character and Country Code
("0" for USA)

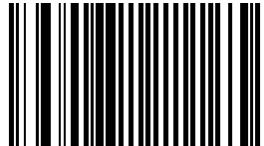

Convert UPC-E to UPC-A

When this parameter is enabled, UPC-E (zero suppressed) decoded data is converted to UPC-A format before transmission. After conversion, data follows UPC-A format and is affected by UPC-A programming selections (e.g. Preamble, Check Digit, etc.).

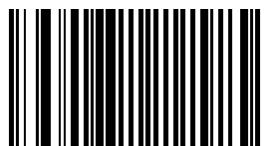

When disabled, UPC-E (zero suppressed) decoded data is transmitted without conversion.

Select an option by scanning either of the bar codes shown below.

Enable UPC-E to UPC-A

* Disable UPC-E to UPC-A

Convert UPC-E1 to UPC-A

When this parameter is enabled, UPC-E1 (zero suppressed) decoded data is converted to UPC-A format before transmission. After conversion, data follows UPC-A format and is affected by UPC-A programming selections (e.g. Preamble, Check Digit, etc.).

When disabled, UPC-E1 (zero suppressed) decoded data is transmitted without conversion.

Select an option by scanning either of the bar codes shown below.

Enable Convert UPC-E1 to UPC-A

* Disable Convert UPC-E1 to UPC-A

EAN-8/JAN-8 Extend

When this parameter is enabled, five leading zeros are added to decoded EAN-8 symbols to make them compatible in format to EAN-13 symbols. Use parameter “Convert EAN-8 to EAN-13 Type” to label the extended symbol.

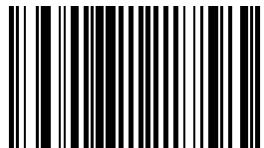

When disabled, EAN-8 symbols are transmitted as is and parameter “Convert EAN-8 to EAN-13 Type” setting is ignored.

Select an option by scanning either of the bar codes shown below.

Enable EAN-8/JAN-8 Zero Extend

* Disable EAN-8/JAN-8 Zero Extend

UCC Coupon Extended Code

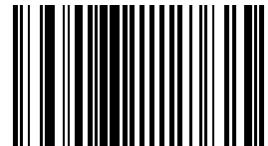

Note: UCC Coupon Extended Code replaces UPC/EAN Coupon Code.

The UCC Coupon Extended Code is an additional bar code adjacent to a UCC Coupon Code. To enable or disable UCC Coupon Extended Code, scan the appropriate bar code below.

When enabled, this parameter decodes UPC-A bar codes starting with digit “5”, EAN-13 bar codes starting with digit “99” and UPC-A/EAN-128 Coupon Codes.

UPCA, EAN-13 and EAN-128 must be enabled to scan all types of Coupon Codes.

Enable UCC Coupon Extended Code

* Disable UCC Coupon Extended Code

Note: Use the Decode UPC/EAN Supplemental Redundancy parameter to control autodiscrimination of the EAN128 (right half) of a coupon code.

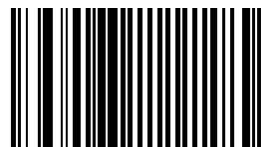

Code 128

Set this parameter by scanning either of the bar codes shown below.

* Enable Code 128

Disable Code 128

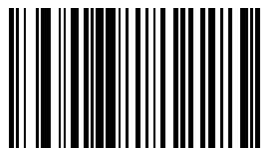

UCC/EAN-128

Set this parameter by scanning either of the bar codes shown below.

* Enable UCC/EAN-128

Disable UCC/EAN-128

ISBT-128

ISBT-128 is a variant of Code 128 used in the blood bank industry. If necessary, the host must perform concatenation of the ISBT data.

Set this parameter by scanning either of the bar codes shown below.

* Enable ISBT-128

Disable ISBT-128

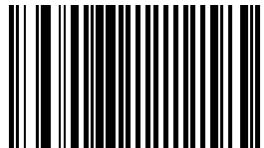

Code 39

Note: This parameter must be enabled when “Convert Code 39 to Code 32” is to be enabled.

Set this parameter by scanning either of the bar codes shown below.

* Enable Code 39

Disable Code 39

Trioptic Code 39

Trioptic Code 39 symbols always contain six characters.

When Trioptic Code 39 is enabled, set the [Code 39 Full ASCII](#) parameter to disabled. Both parameters should not be enabled simultaneously.

Set this parameter by scanning either of the bar codes shown below.

Enable Trioptic Code 39

* Disable Trioptic Code 39

Convert Code 39 to Code 32

Note: [Code 39](#) must be enabled in order for this parameter to function.

Note: When parameter [Code 32 Prefix](#) is to be enabled, this Convert Code 39 to Code 32 (Italian Pharmacy Code) parameter must also be enabled.

Set this parameter by scanning either of the bar codes shown below.

Enable Convert Code 39 to Code 32

* Disable Convert Code 39 to Code 32

Code 32 Prefix

This parameter adds the prefix character “A” to all Code 32 bar codes.

Note: When enabled, “[Convert Code 39 to Code 32](#)” parameter must also be enabled.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 32 Prefix

* Disable Code 32 Prefix

Set Length(s) for Code 39

L1 Parameter Default Value: 2

L2 Parameter Default Value: 55

Lengths for Code 39 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains. If Code 39 Full ASCII is enabled, Length Within a Range or Any Length are the preferred options.

See the table titled [ASCII Character Equivalents](#).

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 39 symbols containing 14 characters, scan the following bar code and then “1” and “4” bar codes using the [Imager Keypad Number Symbols](#). Single digits must be preceded by a zero.

To begin setting one discrete length, scan this **One Discrete Length** bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan [Cancel](#) on the Imager Keypad Number Symbols page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 39 symbols containing 2 or 14 characters, scan the following bar code and then “0”, “2”, “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting two discrete lengths, scan this **Two Discrete Lengths** bar code:

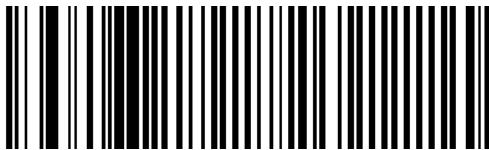

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan [Cancel](#) on the Imager Keypad Number Symbols page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 39 symbols containing between 4 and 12 characters, scan the “Code 39 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting lengths within a range, scan this **Length Within Range** bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Any Length

This option decodes Code 39 bar codes containing any number of characters.

To set any length, scan this **Any Length** bar code:

Code 39 Check Digit Verification

When enabled, this parameter checks the integrity of a Code 39 symbol to ensure it complies with specified check digit algorithms.

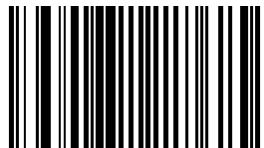

Only Code 39 symbols which include a Modulo 43 check digit are decoded when this parameter is enabled.

Note: When [Transmit Code 39 Check Digit](#) is enabled, this parameter must be enabled too.

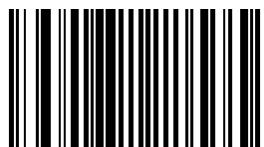

Enable this feature if the code 39 bar codes contain a Modulo 43 check digit.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 39 Check Digit Verification

* Disable Code 39 Check Digit Verification

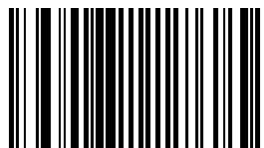

Transmit Code 39 Check Digit

When enabled, the check digit is transmitted with the data.

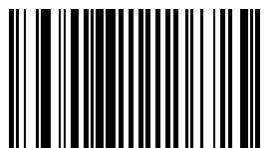

Note: [Code 39 Check Digit Verification](#) must be enabled for this parameter to function.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit Code 39 Check Digit

* Disable Transmit Code 39 Check Digit

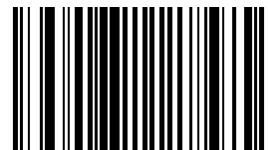

Code 39 Full ASCII Conversion

Note: Code 39 Full ASCII and [Trioptic Code 39](#) should not be enabled simultaneously.

Code 39 Full ASCII is a variant of Code 39 which pairs characters to encode the full ASCII character set.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 39 Full ASCII Conversion

* Disable Code 39 Full ASCII Conversion

When enabled, the ASCII character set assigns a code to letters, punctuation marks, numerals, and most control keystrokes on the keyboard.

The first 32 codes are non-printable and are assigned to keyboard control characters such as [Backspace] and [Return or Enter]. The other 96 are called printable codes because all but [Space] and [Delete] produce visible characters.

Code 39 Full ASCII interprets the bar code special character (\$ + % /) preceding a Code 39 character and assigns an ASCII character value to the pair.

See the table titled "[ASCII Character Equivalents](#)".

Code 93

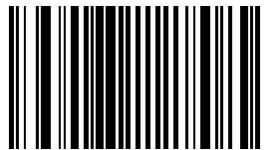

Parameter Default Value:

- Disable Code 93
 - L1 Parameter Default Value : 4
 - L2 Parameter Default Value: 55

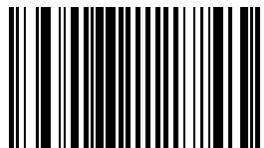

When enabled, Code 93 symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 93

* Disable Code 93

Set Lengths for Code 93

L1 Parameter Default Value: 4 L2 Parameter Default Value: 55

Lengths for Code 93 may be set for:

- any length,
 - one or two discrete lengths,
 - or lengths within a specific range.

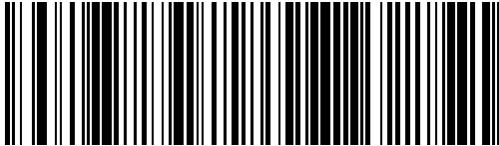

The length of a code refers to the number of characters, including check digits, the code contains.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 93 symbols containing 14 characters, scan the “Code 93 One Discrete Length” bar code and then “1” and “4” bar codes using the [“Imager Keypad Number Symbols”](#).

To begin setting one discrete length, scan this **Code 93 One Discrete Length** bar code:

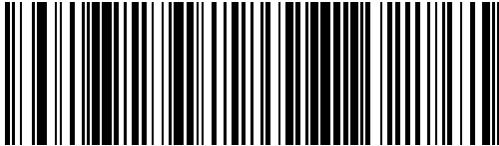

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 93 symbols containing 2 or 14 characters, scan the “Code 93 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [“Imager Keypad Number Symbols”](#).

To begin setting two discrete lengths, scan this **Code 93 Two Discrete Lengths** bar code:

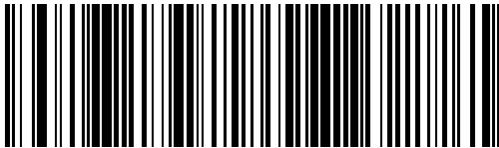

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 93 symbols containing between 4 and 12 characters, scan the “Code 93 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Imager Keypad Number Symbols”](#).

To begin setting lengths within a range, scan this **Code 93 Length Within Range** bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the [“Imager Keypad Number Symbols”](#) page.

Any Length

This option decodes Code 93 bar codes containing any number of characters.

To set any length, scan this **Code 93 Any Length** bar code:

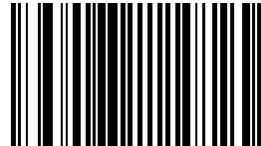

Code 11

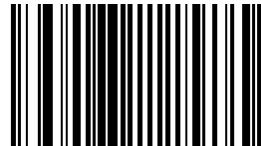

When enabled, Code 11 symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable Code 11

* Disable Code 11

Set Lengths for Code 11

L1 Parameter Default Value: 4 L2 Parameter Default Value: 55

Lengths for Code 11 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

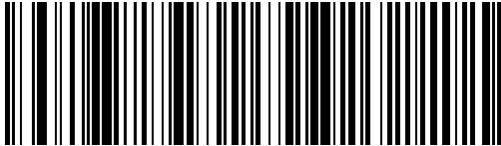

The length of a code refers to the number of characters, including check digits, the code contains. It also includes any start or stop characters.

See the table titled [ASCII Character Equivalents](#).

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Code 11 symbols containing 14 characters, scan the “Code 11 One Discrete Length” bar code and then “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting one discrete length, scan this **Code 11 One Discrete Length** bar code:

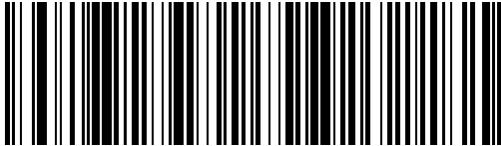

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only Code 11 symbols containing 2 or 14 characters, scan the Code 11 Two Discrete Lengths bar code and then “0”, “2”, “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting two discrete lengths, scan this **Code 11 Two Discrete Lengths** bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “[Imager Keypad Number Symbols](#)” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Code 11 symbols containing between 4 and 12 characters, scan the “Code 11 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes.

To begin setting lengths within a range, scan this **Code 11 Length Within Range** bar code:

Next, scan numeric bar codes that correspond to the desired value using the [Imager Keypad Number Symbols](#). Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Any Length

This option decodes Code 11 bar codes containing any number of characters.

To set any length, scan this **Code 11 Any Length** bar code:

Code 11 Check Digit Verification

Enable this parameter by scanning either One Check Digit bar code or Two Check Digits bar code.

When enabled, this parameter checks the integrity of a Code 11 symbol to ensure it complies with the specified check digit algorithm.

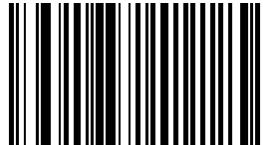

Note: Enable Code 11 Check Digit Verification when Transmit Code 11 Check Digits is enabled.

Set this parameter by scanning one of the bar codes shown below.

* Disable Code 11 Check Digit Verification

One Check Digit

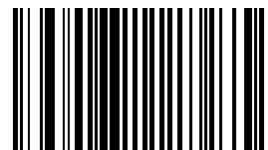

Two Check Digits

Transmit Code 11 Check Digits

[Code 11 Check Digit Verification](#) must be enabled for this parameter to function.

Transmit (Enable) Code 11 Check Digits

* Do Not Transmit (Disable) Code 11 Check Digits

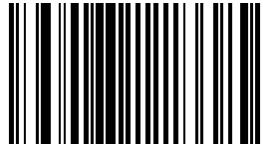

Interleaved 2 of 5 (ITF)

When enabled, Interleaved 2 of 5 (I 2 of 5) symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

* Enable Interleaved 2 of 5

Disable Interleaved 2 of 5

Set Lengths for I 2 of 5

L1 Parameter Default Value: 14

L2 Parameter Default Value: 14

Lengths for Interleaved 2 of 5 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains.

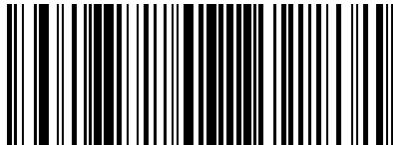

See the table titled "[ASCII Character Equivalents](#)".

Note: Due to the construction of the I 2 of 5 symbology, it is possible for a scan line covering only a portion of the code to be interpreted as a complete scan, yielding less data than is encoded in the bar code. To prevent this, select specific lengths (using I 2 of 5 – One Discrete Length and I 2 of 5 Two Discrete Lengths) for I 2 of 5 applications.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only I 2 of 5 symbols containing 14 characters, scan the “I 2 of 5 One Discrete Length” bar code and then “1” and “4” bar codes using the “[Imager Keypad Number Symbols](#)”.

To begin setting one discrete length, scan this **I 2 of 5 One Discrete Length** bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only I 2 of 5 symbols containing 2 or 14 characters, scan the “I 2 of 5 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the “[Imager Keypad Number Symbols](#)”.

To begin setting two discrete lengths, scan this **I 2 of 5 Two Discrete Lengths** bar code:

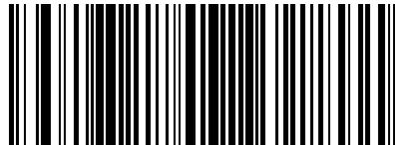

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only I 2 of 5 symbols containing between 4 and 12 characters, scan the “I 2 of 5 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Imager Keypad Number Symbols”](#).

To begin setting lengths within a range, scan this **I 2 of 5 Length within Range** bar code:

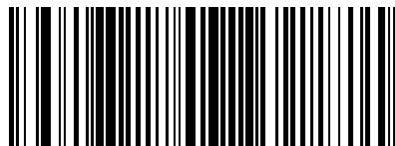

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Any Length

This option decodes I 2 of 5 bar codes containing any number of characters.

Note: Selecting this option may lead to misdecodes for I 2 of 5 codes.

To set any length, scan this **I 2 of 5 Any Length** bar code:

I 2 of 5 Check Digit Verification

When enabled, this parameter checks the integrity of an I 2 of 5 symbol to ensure it complies with a specified algorithm, either USS (Uniform Symbology Specification) or OPCC (Optical Product Code Council).

Set this parameter by scanning one of the bar codes shown below.

* Disable I 2 of 5 Check Digit Verification

USS (Uniform Symbology Specification)

OPCC (Optical Product Code Council)

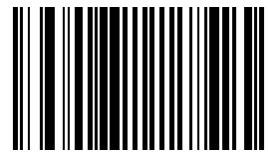

Transmit I 2 of 5 Check Digit

When enabled, the check digit is transmitted with the data.

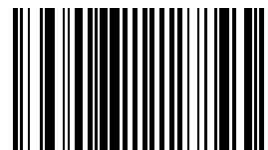

Parameter setting for "I 2 of 5 Check Digit Verification" has no effect on this parameter value.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit I 2 of 5 Check Digit

* Disable Transmit I 2 of 5 Check Digit

Convert I 2 of 5 to EAN 13

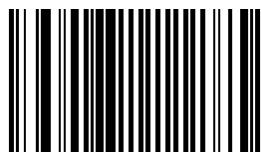

A successful bar code conversion requires the following to be true:

- Interleaved 2 of 5 scanning is enabled.
- One of the I 2 of 5 lengths is set to 14.
- The bar code has a leading zero.
- The bar code has a valid EAN-13 check digit.

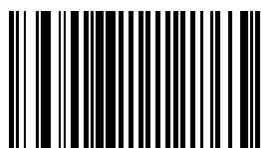

When enabled, the parameter converts a 14 character I 2 of 5 bar code into EAN-13 and transmits it to the host as EAN-13.

Set this parameter by scanning either of the bar codes shown below.

Enable Convert I 2 of 5 to EAN-13

* Disable Convert I 2 of 5 to EAN-13

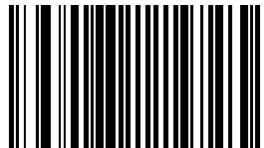

Discrete 2 of 5 (DTF)

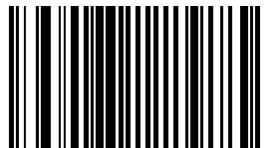

When enabled, Discrete 2 of 5 (D 2 of 5) symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable Discrete 2 of 5

* Disable Discrete 2 of 5

Set Lengths for Discrete 2 of 5

L1 Parameter Default Value: 1 Discrete Length: 12

L2 Parameter Default Value: 12

Lengths for D 2 of 5 may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains.

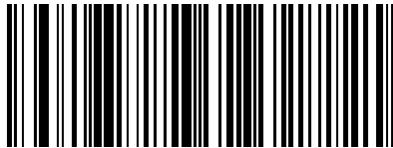

Note: Due to the construction of the D2 of 5 symbology, it is possible for a scan line covering only a portion of the code to be interpreted as a complete scan, yielding less data than is encoded in the bar code. To prevent this, select specific lengths (using D2 of 5 – One Discrete Length and D 2 of 5 Two Discrete Lengths) for D 2 of 5 applications.

See the table titled [ASCII Character Equivalents](#).

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only D 2 of 5 symbols containing 14 characters, scan the “D 2 of 5 One Discrete Length” bar code and then “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting one discrete length, scan this **D 2 of 5 One Discrete Length** bar code:

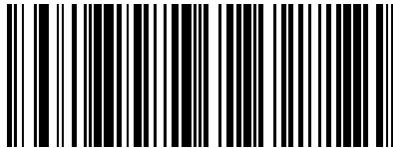

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only D 2 of 5 symbols containing 2 or 14 characters, scan the “D 2 of 5 Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting two discrete lengths, scan this **D 2 of 5 Two Discrete Lengths** bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only D 2 of 5 symbols containing between 4 and 12 characters, scan the “D 2 of 5 Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting lengths within a range, scan this **D 2 of 5 Length Within Range** bar code:

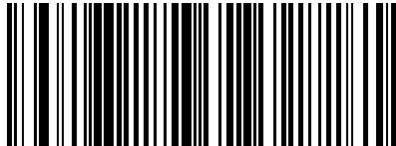

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Any Length

This option decodes D 2 of 5 bar codes containing any number of characters.

Note: Selecting this option may lead to misdecodes for D 2 of 5 codes. See next note.

To set any length, scan this **D 2 of 5 Any Length** bar code:

Note: Due to the construction of the D2 of 5 symbology, it is possible for a scan line covering only a portion of the code to be interpreted as a complete scan, yielding less data than is encoded in the bar code. To prevent this, select specific lengths (using D2 of 5 – One Discrete Length and D 2 of 5 Two Discrete Lengths) for D 2 of 5 applications.

Codabar

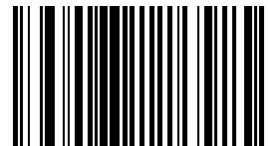

When enabled, Codabar symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable Codabar

* Disable Codabar

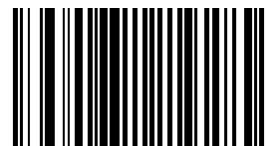

CLSI Editing

When enabled, the start and stop characters are stripped from the bar code and a space is inserted after the 1st, 5th, and 10th characters of a 14 character Codabar symbol.

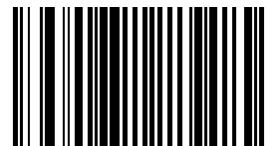

Set this parameter by scanning either of the bar codes shown below.

Note: Symbol length does not include start and stop characters.

Enable CLSI Editing

* Disable CLSI Editing

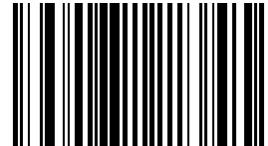

NOTIS Editing

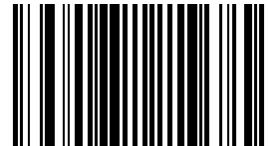

When enabled, the start and stop characters are stripped from a decoded Codabar symbol.

Set this parameter by scanning either of the bar codes shown below.

Enable NOTIS Editing

* Disable NOTIS Editing

Set Lengths for Codabar

L1 Parameter Default Value: 5

L2 Parameter Default Value: 55

Lengths for Codabar may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

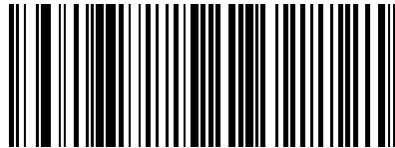

The length of a code refers to the number of characters, including check digits, the code contains. It also includes any start or stop characters.

See the table titled [ASCII Character Equivalents](#).

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only Codabar symbols containing 14 characters, scan the Codabar One Discrete Length bar code and then “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting one discrete length, scan this **Codabar One Discrete Length** bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths.

For example, when you want to scan only Codabar symbols containing 2 or 14 characters, scan the Codabar Two Discrete Lengths bar code and then “0”, “2”, “1” and “4” bar codes using the [Imager Keypad Number Symbols](#).

To begin setting two discrete lengths, scan this **Codabar Two Discrete Lengths** bar code:

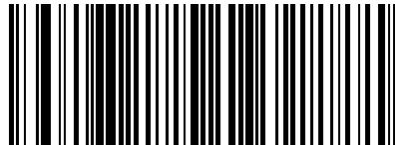

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only Codabar symbols containing between 4 and 12 characters, scan the Codabar Length Within Range bar code and then “0”, “4”, “1” and “2” bar codes using the [Imager Keypad Number Symbols](#) .

To begin setting lengths within a range, scan this **Codabar Length Within Range** bar code:

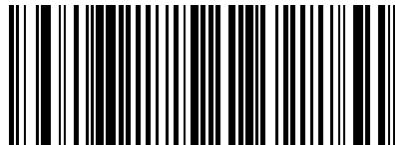

Next, scan numeric bar codes that correspond to the desired value using the Imager Keypad Number Symbols. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the Imager Keypad Number Symbols page.

Any Length

This option decodes Codabar bar codes containing any number of characters.

To set any length, scan this **Codabar Any Length** bar code:

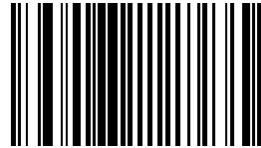

MSI

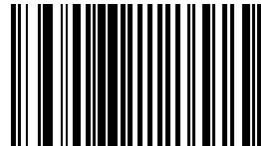

When enabled, MSI symbols will be scanned, decoded and transmitted.

Set this parameter by scanning either of the bar codes shown below.

Enable MSI

* Disable MSI

Set Length(s) for MSI

Length Within Range

L1 Parameter Default Value: 04

L2 Parameter Default Value: 55

Lengths for MSI may be set for:

- any length,
- one or two discrete lengths,
- or lengths within a specific range.

The length of a code refers to the number of characters, including check digits, the code contains.

Note: Due to the construction of the MSI symbology, it is possible for a scan line covering only a portion of the code to be interpreted as a complete scan, yielding less data than is encoded in the bar code. To prevent this, select specific lengths (using MSI One Discrete Length and MSI Two Discrete Lengths) for MSI applications.

See the table titled “[ASCII Character Equivalents](#)”.

One Discrete Length (Parameter L1)

This option decodes only those codes containing a selected length. For example, when you want to scan only MSI symbols containing 14 characters, scan the “MSI One Discrete Length” bar code and then “1” and “4” bar codes using the “[Imager Keypad Number Symbols](#)”.

To begin setting one discrete length, scan this **MSI One Discrete Length** bar code:

Next, scan two numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Two Discrete Lengths (Parameter L2)

This option decodes only those codes containing two selected lengths. For example, when you want to scan only MSI symbols containing 2 or 14 characters, scan the “MSI Two Discrete Lengths” bar code and then “0”, “2”, “1” and “4” bar codes using the “[Imager Keypad Number Symbols](#)”.

To begin setting two discrete lengths, scan this **MSI Two Discrete Lengths** bar code:

Next, scan four numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Length Within Range

This option decodes a code type within a specified minimum and maximum range. For example, when you want to scan only MSI symbols containing between 4 and 12 characters, scan the “MSI Length Within Range” bar code and then “0”, “4”, “1” and “2” bar codes using the [“Imager Keypad Number Symbols”](#).

To begin setting lengths within a range, scan this **MSI Length Within Range** bar code:

Next, scan numeric bar codes that correspond to the desired value. Single digit numbers must have a leading zero. To correct an error or to change a selection, scan Cancel on the “Imager Keypad Number Symbols” page.

Any Length

This option decodes MSI bar codes containing any number of characters.

Note: Selecting this option may lead to misdecodes for MSI codes. See following Note.

To set any length, scan this **MSI Any Length** bar code:

Note: Due to the construction of the MSI symbology, it is possible for a scan line covering only a portion of the code to be interpreted as a complete scan, yielding less data than is encoded in the bar code. To prevent this, select specific lengths (using MSI One Discrete Length and MSI Two Discrete Lengths) for MSI applications.

MSI Check Digits

With MSI symbols, one check digit is mandatory and always verified by the reader. The second check digit is optional.

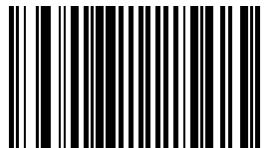

If the MSI codes include two check digits, scan the Two MSI Check Digits bar code to enable verification of the second check digit.

Check digits are not automatically transmitted with the data.

Note: When Two MSI Check Digits is selected, an [MSI Check Digit Algorithm](#) must also be selected.

Set the number of check digits to be included with the bar code by scanning either of the bar codes shown below.

* One MSI check digit

Two MSI check digits

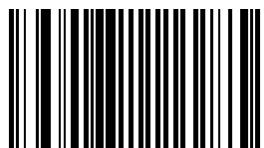

Transmit MSI Check Digit

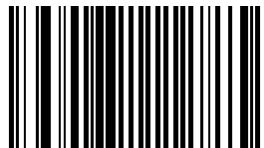

When enabled, the check digit is transmitted with the data.

Set this parameter by scanning either of the bar codes shown below.

Enable Transmit MSI Check Digit

* Disable Transmit MSI Check Digit

MSI Check Digit Algorithm

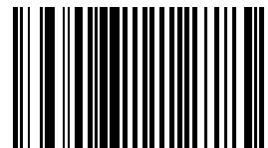

With MSI symbols, one check digit is mandatory and always verified by the reader. The second check digit is optional.

If the MSI codes include two check digits, scan the [*Two MSI Check Digits*](#) bar code to enable verification of the second check digit.

When the “Two MSI Check Digits” option is selected, an additional verification is required to ensure integrity. Either of the two following algorithms may be selected.

Set this parameter by scanning either of the bar codes shown below.

Mod 10/Mod 11
MSI Check Digit Algorithm

* Mod 10/Mod 10
MSI Check Digit Algorithm

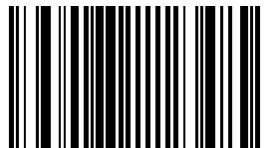

Postal Codes

Note: The default value for all Postal Code symbologies is “Enabled.” For best performance when reading a specific postal symbology, all other postal symbologies should be disabled.

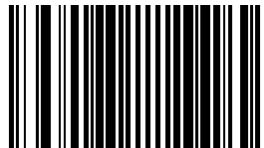

US Postnet

To enable or disable US Postnet, scan the appropriate bar code:

* Enable US Postnet

Disable US Postnet

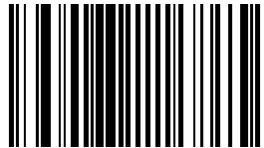

US Planet

To enable or disable US Planet, scan the appropriate bar code:

* Enable US Planet

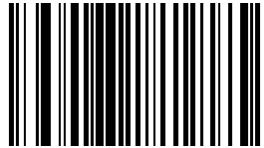

Disable US Planet

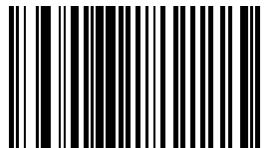

UK Postal

To enable or disable UK Postal, scan the appropriate bar code:

* Enable UK Postal

Disable UK Postal

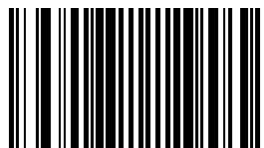

Transmit UK Postal Check Digit

Select whether to transmit UK Postal data with or without the check digit:

* Transmit UK Postal Check Digit

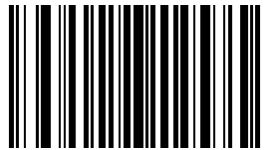

Do Not Transmit UK Postal Check Digit

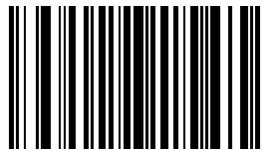

Japan Postal

To enable or disable Japan Postal, scan the appropriate bar code:

* Enable Japan Postal

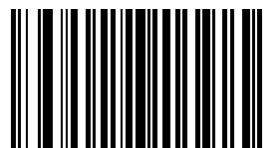

Disable Japan Postal

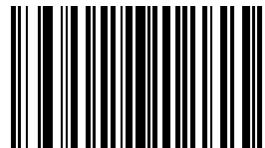

Australian Postal

To enable or disable Australian Postal, scan the appropriate bar code:

* Enable Australian Postal

Disable Australian Postal

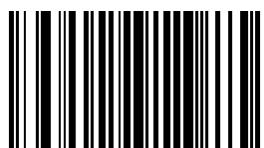

Dutch Postal

To enable or disable Dutch Postal, scan the appropriate bar code:

* Enable Dutch Postal

Disable Dutch Postal

Transmit US Postal Check Digit

Select whether to transmit US Postal data with or without the check digit:

* Transmit US Postal Check Digit

Do Not Transmit US Postal Check Digit

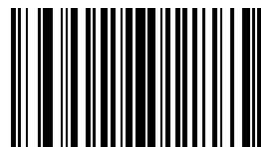

4 State Postal

To enable or disable 4 State Postal, scan the appropriate bar code:

Enable 4 State Postal

* Disable 4 State Postal

GS1 DataBar (RSS)

The variants of GS1 DataBar [RSS (Reduced Space Symbology)] are GS1 DataBar Omnidirectional (RSS-14), GS1 DataBar Expanded (RSS Expanded) and GS1 DataBar Limited (RSS Limited). The limited and expanded versions have stacked variants.

Scan the appropriate bar codes that follow to enable or disable each variant of GS1 DataBar (RSS).

GS1 DataBar Omnidirectional (RSS-14)

To enable or disable GS1 DataBar Omnidirectional (RSS-14), scan the appropriate bar code:

* Enable GS1 DataBar Omnidirectional (RSS-14)

Disable GS1 DataBar Omnidirectional (RSS-14)

See Also: [Convert GS1 DataBar \(RSS\) to UPC/EAN](#)

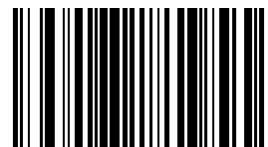

GS1 DataBar Limited (RSS Limited)

To enable or disable GS1 DataBar Limited (RSS Limited), scan the appropriate bar code:

* Enable GS1 DataBar Limited (RSS Limited)

Disable GS1 DataBar Limited (RSS Limited)

See Also: "[Convert GS1 DataBar \(RSS\) to UPC/EAN](#)"

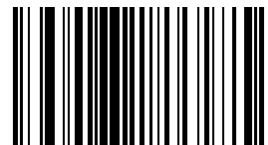

GS1 DataBar Expanded (RSS Expanded)

To enable or disable GS1 DataBar Expanded (RSS Expanded), scan the appropriate bar code:

* Enable GS1 DataBar Expanded (RSS Expanded)

Disable GS1 DataBar Expanded (RSS Expanded)

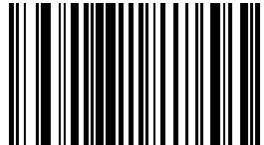

Convert GS1 DataBar (RSS) to UPC/EAN

This parameter only applies to GS1 DataBar Omnidirectional (RSS-14) and GS1 DataBar Limited (RSS Limited) symbols not decoded as part of a Composite symbol.

Enable this parameter to strip the leading “010” from GS1 DataBar Omnidirectional (RSS-14) and GS1 DataBar Limited (RSS Limited) symbols, encoding a single zero as the first digit, and report the bar code as EAN-13.

For bar codes beginning with two or more zeros but not six zeros this parameter strips the leading “0100” and reports the bar code as UPC-A. The UPC-A Preamble parameter that transmits the system character and country code applies to converted bar codes. Note that neither the system character nor the check digit can be stripped.

* Enable Convert GS1 DataBar (RSS) to UPC/EAN

Disable Convert GS1 DataBar (RSS) to UPC/EAN

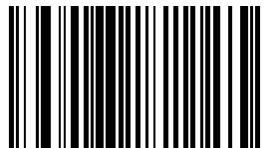

Composite

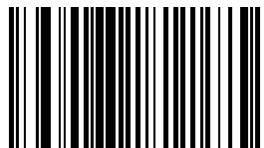

Composite CC-C

Scan one of the following bar codes to enable or disable Composite bar codes of type CC-C.

Enable Composite CC-C

* Disable Composite CC-C

Composite CC-A/B

Scan one of the following bar codes to enable or disable Composite bar codes of type CC-A/B.

Enable Composite CC-A/B

* Disable Composite CC-A/B

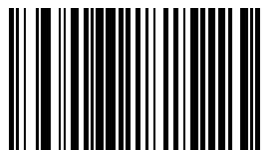

Composite TLC-39

Scan one of the following bar codes to enable or disable Composite bar codes of type TLC-39.

Enable Composite TLC-39

* Disable Composite TLC-39

UPC Composite Mode

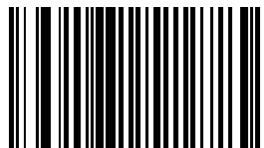

UPC symbols can be linked with a 2D symbol during transmission as if they were one symbol. There are three options for these symbols:

UPC Never Linked	Transmit UPC bar codes regardless of whether a 2D symbol is detected.
UPC Always Linked	Transmit UPC bar codes and the 2D portion. If 2D is not present, the UPC bar code does not transmit.
Autodiscriminate UPC Composites	The decoding engine determines if there is a 2D portion, then transmits the UPC, as well as the 2D portion if present.

UPC Never Linked

* UPC Always Linked

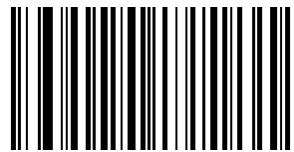

Autodiscriminate UPC Composites

UCC/EAN Code 128 Emulation Mode

Select whether to enable or disable UCC/EAN Code 128 Emulation Mode for UCC/EAN Composite Codes.

Enable UCC/EAN Code 128 Emulation Mode for UCC/EAN
Composite Codes

* Disable UCC/EAN Code 128 Emulation Mode for UCC/EAN
Composite Codes

2D Symbologies

Aztec

To enable or disable Aztec, scan the appropriate bar code below.

* Enable Aztec

Disable Aztec

Aztec Inverse

This parameter controls the setting of the Aztec Inverse decoder. Scan the appropriate bar code below.

* Regular Only

Inverse Only

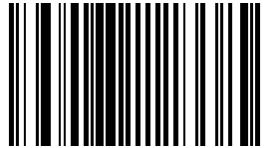

Inverse Auto Detect

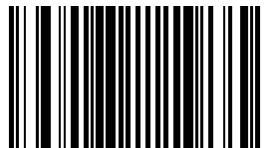

PDF417

To enable or disable PDF417, scan the appropriate bar code below.

* Enable PDF417

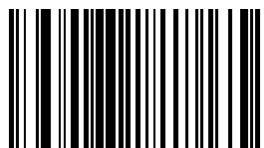

Disable PDF417

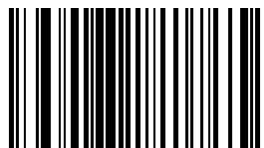

MicroPDF417

To enable or disable MicroPDF417, scan the appropriate bar code below.

Enable MicroPDF417

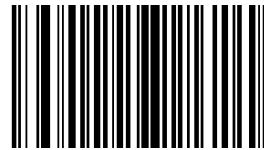

* Disable MicroPDF417

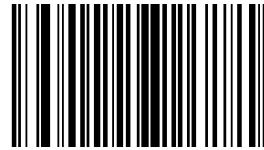

Code 128 Emulation

To enable or disable Code 128 Emulation, scan the appropriate bar code below.

Enable Code 128 Emulation

* Disable Code 128 Emulation

When this parameter is enabled, the scanner transmits data from certain MicroPDF417 symbols as if it was encoded in Code 128 symbols. Transmit AIM Symbology Identifiers must be enabled for this parameter to work.

If Code 128 Emulation is enabled, these MicroPDF417 symbols are transmitted with one of the following prefixes:

-]C1 if the first codeword is 903-907, 912, 914, 915
-]C2 if the first codeword is 908 or 909
-]C0 if the first codeword is 910 or 911

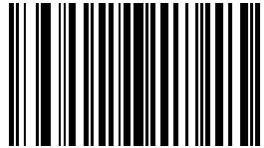

If disabled, they are transmitted with one of the following prefixes:

-]L3 if the first codeword is 903-907, 912, 914, 915
-]L4 if the first codeword is 908 or 909
-]L5 if the first codeword is 910 or 911

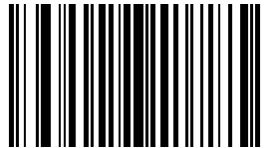

Data Matrix

To enable or disable Data Matrix, scan the appropriate bar code below.

* Enable Data Matrix

Disable Data Matrix

Data Matrix Inverse

This parameter controls the setting of the Data Matrix inverse decoder. Scan the appropriate bar code below.

* Regular Only

Inverse Only

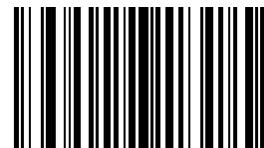

Inverse Auto Detect

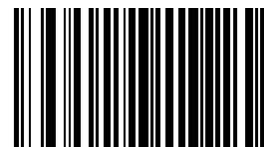

Maxicode

To enable or disable Maxicode scan the appropriate bar code below.

* Enable Maxicode

Disable Maxicode

MicroQR

To enable or disable MicroQR, scan the appropriate bar code below.

* Enable MicroQR

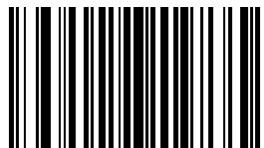

Disable MicroQR

QR Code

To enable or disable QR Code scan the appropriate bar code below.

* Enable QR Code

Disable QR Code

QR Inverse

This parameter controls the setting of the QR Inverse decoder. Scan the appropriate bar code below.

* Regular Only

Inverse Only

Inverse Auto Detect

Redundancy Level

The decoder offers four levels of decode redundancy. Select higher redundancy levels for decreasing levels of bar code quality. As redundancy levels increase, the decoder's aggressiveness decreases.

Select the redundancy level appropriate for the bar code quality and then scan the appropriate Redundancy Level bar code [on the following page](#).

Redundancy Level 1

The following code types must be successfully read twice before being decoded:

Code Type	Code Length
Codabar	8 characters or less
MSI	4 characters or less
D 2 of 5	8 characters or less
I 2 of 5	8 characters or less

Redundancy Level 2

The following code types must be successfully read twice before being decoded:

Code Type	Code Length
All	All

Redundancy Level 3

Code types other than the following must be successfully read twice before being decoded. The following codes must be read three times:

Code Type	Code Length
MSI Plessey	4 characters or less
D 2 of 5	8 characters or less
I 2 of 5	8 characters or less
Codabar	8 characters or less

Redundancy Level 4

The following code types must be successfully read three times before being decoded:

Code Type	Code Length
All	All

* Redundancy Level 1

Redundancy Level 2

Redundancy Level 3

Redundancy Level 4

Security Level

The decoder offers four levels of decode security for delta bar codes, which include the Code 128 family, UPC/EAN, and Code 93.

Select increasing levels of security for decreasing levels of bar code quality.

There is an inverse relationship between security and decoder aggressiveness, so choose only that level of security necessary for any given application.

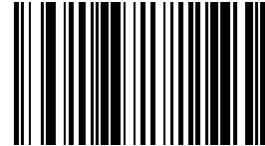

Security Level 0	This setting allows the decoder to operate in its most aggressive state, while providing sufficient security in decoding most ?in-spec? bar codes.
Security Level 1	Select this option if misdecodes occur. This default setting should eliminate most mis-decodes.
Security Level 2	Select this option if Security level 1 fails to eliminate misdecodes.
Security Level 3	If Security Level 2 was selected and misdecodes still occur, select this security level. Be advised, selecting this option is an extreme measure against misdecoding severely out of spec bar codes. Selecting this level of security significantly impairs the decoding ability of the decoder. If this level of security is necessary, try to improve the quality of the bar codes.

Select the security level appropriate for the bar code quality and then scan the appropriate Security Level bar code:

Security Level 0

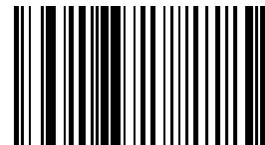

* Security Level 1

Security Level 2

Security Level 3

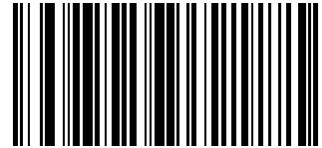

Intercharacter Gap Size

The Code 39 and Codabar symbologies have an intercharacter gap that is typically quite small. Due to various bar code-printing technologies, this gap can grow larger than the maximum size allowed, preventing the decoder from decoding the symbol.

If this problem occurs, scan the *Large Intercharacter Gaps* parameter to tolerate these out-of-specification bar codes.

* Normal Intercharacter Gaps

Large Intercharacter Gaps

Imager Keypad Number Symbols

The bar code labels shown below represent a numeric keypad, with decimal values 0 through 9. Each label should be scanned individually.

Use these numeric value symbols to enter numeric input in the course of performing an imager engine system configuration.

To correct an error or change a selection, scan Cancel then scan a desired bar code.

Chapter 5: BlueCore Device Firmware Update Installation Instruction

Prerequisites:

- BlueCore Device Firmware Update program (Contact [Technical Assistance](#) to obtain the BlueCore Device Firmware Update file).
- A desktop/laptop Windows XP (or later) PC with an available USB port.
- A Bluetooth module and a fully charged battery.
- Bluetooth Module Firmware update cable (8650A051CBLBTUPDATE).
- Firmware update file (Contact [Technical Assistance](#) to obtain the latest Bluetooth Module firmware update file).

Note: A Bluetooth module is required when performing the initial install of the BlueCore Device Firmware Update program on the PC.

Install BlueCore Device Update Wizard and Driver

1. Install the BlueCore Device Update Wizard on a PC by doubleclicking the DFUWizardSetup[version].exe file located in the Install folder.
2. Accept the license agreement, choose typical installation and then select Finish.
3. Insert the battery into the Bluetooth module to be updated (or used for the initial installation of the BlueCore Device Update Wizard).
4. Insert the update cable into the Bluetooth module to be updated. The module should power up, indicated by a beep sequence and the blue LED illuminating then flashing.
5. Insert the USB update cable into one of the host PC USB ports. The PC should recognize that a USB device has been detected.
6. A message will appear stating the USB device driver needs to be installed on the PC.
7. The Windows Found New Hardware Wizard dialogue may appear requesting to connect to Windows Update to search for software. Select No, not this time. Then click Next to continue. If the dialogue box shown below does not appear, continue.

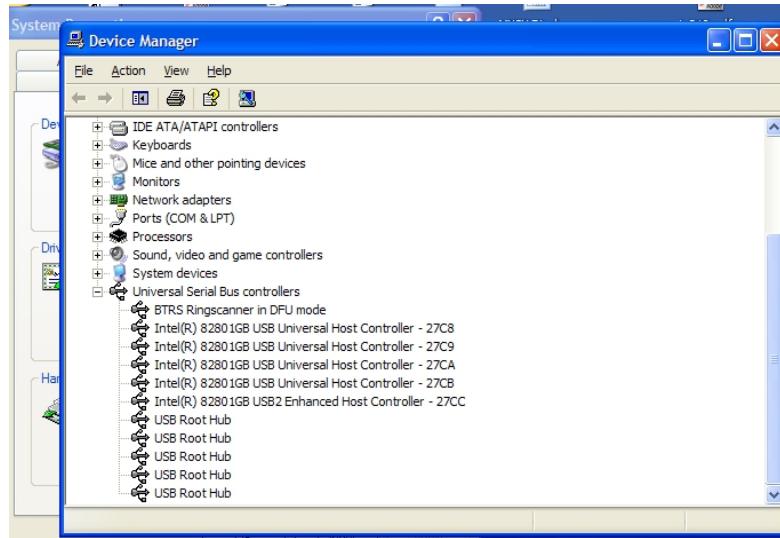

-
8. The next dialogue box appears to help you install software for the BTRS Ring Scanner.
 9. Select Install from a list or specific location. Click Next to continue.

10. Browse to the driver location on the installation CD (/driver) or your hard drive, if the installation program was downloaded to your hard drive, and click Next.
11. Click Continue Anyway when the dialog box appears stating "the driver has not passed Windows logo testing to verify compatibility".

12. Select Finish on the next dialog box.
13. Navigate to the Windows Device Manager screen. On WindowsXP devices, one path to the Device Manager screen is Start > Control Panel > System > Hardware tab and click the Device Manager button. Shown below is a sample of a Device Manager screen.

14. Click the plus sign next to Universal Serial Bus controllers. Verify the BTRS Ringscanner in DFU mode is present.
Close all open windows and return to the PC desktop.
15. You are ready to update the Bluetooth Ring Scanner module firmware.

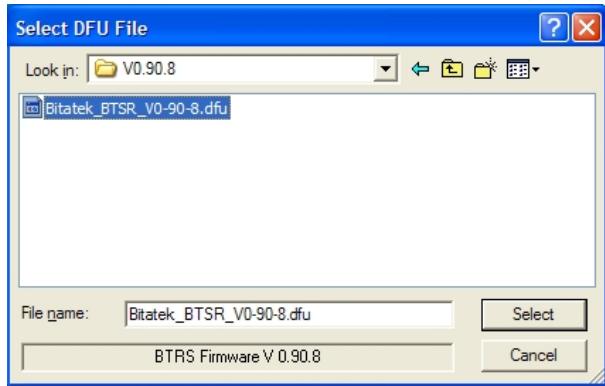

Update the Module Firmware

Note: The module in this segment refers to the module used when installing the BlueCore Device Update Wizard application.

1. Click Start | All Programs and start the BlueCore Device Firmware Update Wizard application.
2. Click Next to begin the upgrade process.
3. Select how the Bluetooth module is connected to your PC by choosing the Universal Serial Bus (USB) connection type. Click Next to continue.

4. Select Download a new version of the firmware, saving a copy of the current version first. Any previous version will be replaced.
5. Browse to and highlight the latest firmware upgrade file. The file has a DFU extension. Click Select to continue.

6. The upgrade process proceeds and ends with a Successful Upgrade message (see step 7). The Bluetooth module may emit a series of beeps or the blue LED may stop flashing and remain illuminated until the upgrade is finished.

7. Click Finish.

Chapter 6: Decode Zones

The scan ranges listed in the following tables are based on the following factors:

- Decode zone is a function of various symbol characteristics including density, print contrast, wide-to-narrow ratio and edge acuity. Symbol's test labels of the part numbers given are examples of optimum quality bar codes.
- As distance decreases the visible scan line also decreases (visible scan length = $1.8 \times$ distance to label \times TAN (scan angle / 2)). The useable scan length is approximately 90% of visible scan line and must fully encompass the bar code label to be successfully decoded. On larger symbol densities of 20 mil, 40 mil and 55 mil, this affects minimum decode distance.
- + / - 5 degree pitch is used to reduce the inhibiting effects of spectral reflection (glare) near 0 degree of the scan head aspect to the bar code. Optimal operation is obtained at 2 degrees to 15 degrees pitch offset.
- Scan rate of 25 + / - scans second with bi-directional redundancy.
- The long range and advanced long range scanners support the aim-mode feature which allows generation of the laser for aiming prior to actual bar code decoding with a duration from 1 second to 8 second.

Ring Scanner

Factory Default Scan Angle -- Wide (47 degrees)

Symbol Density	Typical Working Ranges		Guaranteed Working Ranges	
	Near	Far	Near	Far
4 mil	1.0 in / 2.50 cm	5.50 in / 13.97 cm	2.20 in / 5.60 cm	3.20 in / 8.13 cm
5 mil	1.25 in / 3.18 cm	8.00 in / 20.32 cm	2.20 in / 5.60 cm	5.50 in / 13.97 cm
7.5 mil	1.50 in / 3.81 cm	13.00 in / 33.02 cm	2.00 in / 5.08 cm	9.50 in / 24.13 cm
10 mil	1.50 in / 3.81 cm	18.00 in / 45.72 cm	1.75 in / 4.45 cm	14.00 in / 35.56 cm
13 mil	1.50 in / 3.81 cm	24.00 in / 60.96 cm	1.75 in / 4.45 cm	18.00 in / 45.72 cm
15 mil	1.50 in / 3.81 cm	28.00 in / 71.12 cm	1.75 in / 4.45 cm	21.00 in / 53.34 cm
20 mil	1.75 in / 4.45 cm	33.00 in / 83.82 cm	*	27.00 in / 68.58 cm
40 mil	*	36.00 / 91.44 cm	*	28.00 in / 71.12 cm
55 mil	*	45.00 in / 114.30 cm	*	34.00 in / 86.36 cm

* Near ranges are largely dependent upon the width of the bar code and the scan angle.

Ring Imager

PL4407 Near Focus Decode Distances

Symbol Density	Typical Working Ranges		Guaranteed Working Ranges	
	Near	Far	Near	Far
5.0 mil	3.5 in / 8.9 cm	7.0 in / 17.8 cm	4.25 in / 10.8 cm	6.0 in / 15.2 cm

	Far	4.25 in / 10.8 cm	7.125 in / 18.1 cm
10 mil	Near	3.25 in / 8.3 cm	6.375 in / 16.2 cm
	Far	5.75 in / 14.6 cm	7.25 in / 18.4 cm
13 mil	Near	2.25 in / 5.7 cm	7.375 in / 18.7 cm
	Far	3.00 in / 7.6 cm	8.375 in / 21.3 cm

* Near ranges are field-of-view limited. Working range specifications at temperature 23 degrees C.

Chapter 7: Bluetooth Module Technical Specifications

I/O Port	A 22 spring-pin, symmetrical port
Module Size	Without Scanner : Height 0.75" / 1.90cm x Width 1.75" / 4.44cm x Length 2.4" / 6.1cm With Scanner : Height 0.75" / 1.90cm x Width 1.75" / 4.44cm x Length 2.9" / 7.4cm
Module Weight	2.15oz / 60.9g with battery / 1.60oz / 45g without battery 4.05 – 4.15oz / 114g – 117g with battery and scanner Ring Scanner : 1.75oz / 49.6g Ring Imager : 1.85oz / 52.4g
Battery	Li-Ion, 3.7v 750mAh with a 500 charge/discharge life cycle
Environmental	
Operating Temperature	-4° F to 122° F (-20° C to +50° C)
Storage Temperature	-40° F to 158° F (-40°C to +60°C)
Water and Dust Resistance	Sealed to IP-54 specifications or better
Humidity	5% to 95% relative humidity, non-condensing
Corrosion	Corrosion resistant when exposed to water and common cleaning chemicals
Chemical Resistance	Corrosion resistant when exposed to water and common cleaning chemicals
Abrasion Resistance	Housing resists normal abrasion from dirty hands.

The CF Bluetooth Radio in the Bluetooth Ring Scanner is Bluetooth Special Interest Group (SIG) Qualified, is listed as an EPL (End Product Listing) and with QDID: B011904.

ASCII Character Equivalents

Values from 1128 through 1255 (hex values 80h through FFh) may also be set. But the conversion of those characters to printable characters is not standardized. Therefore, they are not included in the table.

Scan Value	Hex Value	Full ASCII Code 39 Encode Char.	Keystroke

Chapter 8: Technical Assistance

If you need assistance installing or troubleshooting your device, please contact us by using one of the methods below:

Knowledge Base: www.hsmknowledgebase.com

Our Knowledge Base provides thousands of immediate solutions. If the Knowledge Base cannot help, our Technical Support Portal (see below) provides an easy way to report your problem or ask your question.

Technical Support Portal: www.hsmsupportportal.com

The Technical Support Portal not only allows you to report your problem, but it also provides immediate solutions to your technical issues by searching our Knowledge Base. With the Portal, you can submit and track your questions online and send and receive attachments.

Web form: www.hsmcontactsupport.com

You can contact our technical support team directly by filling out our online support form. Enter your contact details and the description of the question/problem.

Telephone: www.honeywellaadc.com/locations

For our latest contact information, please check our website at the link above.

Product Service and Repair

Honeywell International Inc. provides service for all of its products through service centers throughout the world. To obtain warranty or non-warranty service, please visit www.honeywellaadc.com and select **Support > Contact Service and Repair** to see your region's instructions on how to obtain a Return Material Authorization number (RMA #). You should do this prior to returning the product.

Limited Warranty

Honeywell International Inc. ("HII") warrants its products to be free from defects in materials and workmanship and to conform to HII's published specifications applicable to the products purchased at the time of shipment. This warranty does not cover any HII product which is (i) improperly installed or used; (ii) damaged by accident or negligence, including failure to follow the proper maintenance, service, and cleaning schedule; or (iii) damaged as a result of (A) modification or alteration by the purchaser or other party, (B) excessive voltage or current supplied to or drawn from the interface connections, (C) static electricity or electro-static discharge, (D) operation under conditions beyond the specified operating parameters, or (E) repair or service of the product by anyone other than HII or its authorized representatives.

This warranty shall extend from the time of shipment for the duration published by HII for the product at the time of purchase ("Warranty Period"). Any defective product must be returned (at purchaser's expense) during the Warranty Period to HII factory or authorized service center for inspection. No product will be accepted by HII without a Return Materials Authorization, which may be obtained by contacting HII. In the event that the product is returned to HII or its authorized service center within the Warranty Period and HII determines to its satisfaction that the product is defective due to defects in materials or workmanship, HII, at its sole option, will either repair or replace the product without charge, except for return shipping to HII.

EXCEPT AS MAY BE OTHERWISE PROVIDED BY APPLICABLE LAW, THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER COVENANTS OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, ORAL OR WRITTEN, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT.

HII'S RESPONSIBILITY AND PURCHASER'S EXCLUSIVE REMEDY UNDER THIS WARRANTY IS LIMITED TO THE REPAIR OR REPLACEMENT OF THE DEFECTIVE PRODUCT WITH NEW OR REFURBISHED PARTS. IN NO EVENT

SHALL HII BE LIABLE FOR INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, AND, IN NO EVENT, SHALL ANY LIABILITY OF HII ARISING IN CONNECTION WITH ANY PRODUCT SOLD HEREUNDER (WHETHER SUCH LIABILITY ARISES FROM A CLAIM BASED ON CONTRACT, WARRANTY, TORT, OR OTHERWISE) EXCEED THE ACTUAL AMOUNT PAID TO HII FOR THE PRODUCT. THESE LIMITATIONS ON LIABILITY SHALL REMAIN IN FULL FORCE AND EFFECT EVEN WHEN HII MAY HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH INJURIES, LOSSES, OR DAMAGES. SOME STATES, PROVINCES, OR COUNTRIES DO NOT ALLOW THE EXCLUSION OR LIMITATIONS OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY NOT APPLY TO YOU.

All provisions of this Limited Warranty are separate and severable, which means that if any provision is held invalid and unenforceable, such determination shall not affect the validity of enforceability of the other provisions hereof. Use of any peripherals not provided by the manufacturer may result in damage not covered by this warranty. This includes but is not limited to: cables, power supplies, cradles, and docking stations. HII extends these warranties only to the first end-users of the products. These warranties are non-transferable.

The duration of the limited warranty for the Bluetooth Ring Scanner Module is 1 year.

The duration of the limited warranty for the Bluetooth Ring Scanner Module Battery Charger is 1 year.

The duration of the limited warranty for the Bluetooth Ring Scanner Module 750mAh Li-Ion Battery is 6 months.

The duration of the limited warranty for the Bluetooth Ring Scanner Module Ring Scanner and Ring Imager is 1 year.

The duration of the limited warranty for the Bluetooth Ring Scanner fabric accessories (e.g., case, straps) is 90 days.
